# Top 5 Signs of Adrenal Fatigue.

**MARTINCLINIC.COM**

Hey, It's Dr. Martin here...

Thanks for requesting our best newsletters about the adrenal glands and cortisol

Enjoy!

## The Top 5 Signs of Adrenal Fatigue

Your adrenal glands are no bigger than a walnut and weigh less than a grape.

Their main purpose is to help your body deal with stress from every possible source, ranging from injury and disease to work and relationship problems.

Your adrenals may be small, But, don't let their size fool you. These powerful little glands are responsible for creating and managing CORTISOL.

Cortisol is often called the 'stress hormone' since it's released from your adrenal glands in response to stress.

When you feel stressed, your cortisol levels go up. But, even if you don't "feel" stressed, there are many things that your body considers to be stress.

Cortisol doesn't distinguish between physical or emotional stress. This is why things like chemicals, pollution, processed foods, too little or too much exercise can all elevate cortisol.

After over 40 years and tens of thousands of patient visits, I can say with certainty that adrenals are one of the most overlooked cause of hormonal symptoms by mainstream medicine.

How do you know if your adrenals are 'tired' or overworked and you have too much cortisol?

**You're tired all the time.**

It's impossible to have energy when your adrenal glands are overworked. This is the biggest indication that you have an adrenal problem.

**You can't sleep.**

I see a lot of people in my clinic who can't sleep. They can't fall asleep. They can't stay asleep. Even if they manage to fall asleep and stay asleep, they wake up exhausted.

High cortisol levels is the number one cause of insomnia in adults over the age of 40.

**You feel anxious.**

Many feel ‘tensed’ or stressed all day. Some feel irritable, on edge, or moody for no reason.

Why does this happen?

Too much cortisol.

Cortisol acts like a stimulant. It gets your heart beating faster, your breathing gets quicker, and your muscles get tense.

Someone with anxiety feels nervous, restless or tense. They have a sense of impending danger. They have an increased heart rate, and breathing. They can feel weak or tired.

As you can see, high cortisol and anxiety share many of the same symptoms. This is why high cortisol can directly cause anxiety.

**You have strong cravings for junk food.**

Many women with adrenal fatigue or too much cortisol tell me how much they crave sugar or salts.

Why does this happen?

One of the main things that cortisol does is RAISE your blood sugar levels. When you’re stressed, your body goes into the “fight or flight” mode and it thinks it needs energy to fight or get away quickly.

Once your blood sugar levels rise, your body will secrete insulin to help lower it again. This is the reason why a stressed person typically craves sugar and carbs. Their blood sugar levels are up and down like a yo-yo.

It’s also pretty much impossible to lose weight if you have chronically elevated cortisol levels.

**You’re sore for no reason.**

This one surprises most people. When your adrenals are overworked and your cortisol levels are too high, your muscles pay the price.

Cortisol tells your muscles to get ready, which means they are tensed. Imagine how much of a beating your muscles take if your cortisol levels are high all the time.

# What is Cortisol and Why it Can Cause BIG Problems?

**MARTINCLINIC.COM**

Hey, It's Dr. Martin here...

Yesterday, I wrote a lot about cortisol.

...and today, I'm going to explain it in 30 seconds because I know you're busy and need to go.

So, let me answer the question...What is cortisol?

Cortisol is a hormone like estrogen or testosterone.

It's made by two triangle looking things that sit on top of your kidneys.

And it's kinda like the little brother to adrenaline.

I call it the 'little brother' to adrenaline because unlike adrenaline which gets your body ready to deal with life or death situations...

Cortisol is a weaker version of it that gets your body ready to deal with everyday life.

Like lifting a weight, solving a problem, waking up in the morning or dealing with a rude person.

In other words, Cortisol...

Is a very good thing to have.

BUT, it can also become a PROBLEM if you have too much.

...And when this happens it will destroy your health.

Cortisol is something you don't want to completely eliminate.

**Instead you want to CONTROL it.**

Control it how? Well...

In a normal HEALTHY person, cortisol levels are supposed to be highest in the morning...

To provide you with energy...

Protection to deal with stress...

And to give you a “zest for life”...

THEN it’s supposed to lower automatically as the day goes on.

...And ‘turn itself’ off at night.

This NORMAL pattern allows you do a bunch of useful things INCLUDING falling asleep easily.

When something in your body goes wrong...

Preventing you from balancing your cortisol levels...

Then your health suffers...big time.

Talk soon,

# The #1 Cause of Poor Sleep.

**MARTINCLINIC.COM**

Hey, It's Dr. Martin here...

I see a lot of people in my clinic who can't sleep.

They can't fall asleep.

They can't stay asleep.

Or Both.

Unfortunately, this has major consequences on their health.

One underrated and rarely talked about fallout of poor sleep is the negative effect it has on your microbiome...

The good bacteria that's found in your gut (and everywhere else).

That may sound weird...

But poor sleep hurts your microbiome.

AND that can lead to other serious problems.

Remember...

Changes in your gut microbiome is associated with diseases such as Type-2 Diabetes, Alzheimer's, Dementia, Parkinson's, etc...

This means that poor sleep can start you on the path to serious problems.

The #1 cause of poor sleep (especially in women) is HIGH CORTISOL.

Cortisol is a hormone tied to your circadian rhythm.

What does that mean?

It means that cortisol is highest in the morning and supposed to be lowest at night.

BUT...

For many people, Cortisol is high ALL THE TIME.

This KILLS your sleep.

Talk soon,

P.S. Over the years we’ve received hundreds of emails from patients sharing with us how much our CORTISOL CONTROL has helped them with their ANXIETY and SLEEP.

When we created Cortisol Control, it’s purpose was simple...

To lower cortisol naturally.

We knew that if cortisol was brought back into balance then our patients would feel better.

But, to be honest...

We weren’t thinking about sleep and anxiety specifically...

Just getting cortisol down.

But now we realize the massive results our patients are getting in those two specific areas and we’re thrilled.

We love hearing from patients how much better their anxiety has gotten and how much better they are sleeping.

Christine A. on Feb 28, 2019

Amazing! It works!

It started helping right away. I have struggled with insomnia for decades. I have tried everything available on the market (including melatonin and tryptophan) and many prescription sleep medications. Nothing works as well as this, and, I have zero side effects! My whole life is better because now I can sleep deeply and if I wake up, I can easily return to sleep! And I wake up a lot less. This is the help I have been longing for for many years!

Jennifer D. on Feb 28, 2019

Cortisol Control Formula

This was one of my first purchases along with Insulin Balance. I am sleeping at night and overall just feel better after the first month. I have also added Navitol and B12 in the last few weeks. I can not say enough about these supplements: fantastic. I will be staying on these and adding to my next order as well. I've also put my husband on

Angie M. on Jan 22, 2019

Cortisol Control

I recently ran out of Cortisol Control and didn't associate that with my impaired ability to handle stress. Once I started back on my regular regimen, I started feeling so much better. I now make sure I always have an extra bottle of Cortisol Control at home.

Kelli L. on Nov 23, 2018

Excellent product!!

Quite some time ago, I was diagnosed with adrenal exhaustion. I have been using the Cortisol Control Formula since my first visit to the clinic, and my results have been nothing short of incredible. To say that moving was an effort before I began this protocol is not an exaggeration. Now I have enough energy to go from 6:30 a.m. to 10:00 p.m. without even noticing the expanse of time. Awesome product!

Teena C. on Nov 22, 2018

Amazing product

I have been taking Cortisol Control Formula for 3 months now. I feel amazing to not have absolutely no anxiety, sleep better, and I can handle stressful situations much better. I take 3 tablets before bed, however if I happen to miss a night I do feel some anxiety the next day. Will not go without it.

# The #1 Cause of Anxiety in Adults 40+.

**MARTINCLINIC.COM**

Hey, It's Dr. Martin here...

It's amazing how many women with bad hormones also struggle with ANXIETY.

Many feel 'tensed' or stressed all day. Some feel irritable, on edge, or moody for no reason.

Why does this happen?

It's the same reason why women with bad hormones can't sleep or can't lose weight.

The culprit is high cortisol.

Why is too much cortisol a bad thing?

First, it's important to understand that we need cortisol, just like every hormone in our body. But, it needs to be balanced.

Cortisol is a hormone that's released from your adrenal glands in response to stress, which is why it's called a stress hormone.

When you feel stressed, your cortisol levels go up. But, even if you don't "feel" stressed, there are many things that your body considers to be stress.

Cortisol doesn't distinguish between physical or emotional stress. This is why things like chemicals, pollution, processed foods, too little or too much exercise can all elevate cortisol.

**Here's the problem with too much cortisol:**

One of the main jobs of cortisol is to raise your blood sugar levels. When you're stressed, your body goes into the "fight or flight" mode and it thinks it needs energy to fight or get away quickly.

In order to get energy, your adrenal glands secrete cortisol which then causes a rise in your blood sugar levels.

Once your blood sugar levels rise, your body will secrete insulin to help lower it again. This is the reason why a stressed person typically craves sugar and carbs. Their blood sugar levels are up and down like a yo-yo.

It's also pretty much impossible to lose weight if you have chronically elevated cortisol levels.

Cortisol also acts like a stimulant. It gets your heart beating faster, your breathing gets quicker, and your muscles get tense.

High cortisol has serious effects on both your body and your mind.

Someone with anxiety feels nervous, restless or tense. They have a sense of impending danger. They have an increased heart rate, and breathing. They can feel weak or tired.

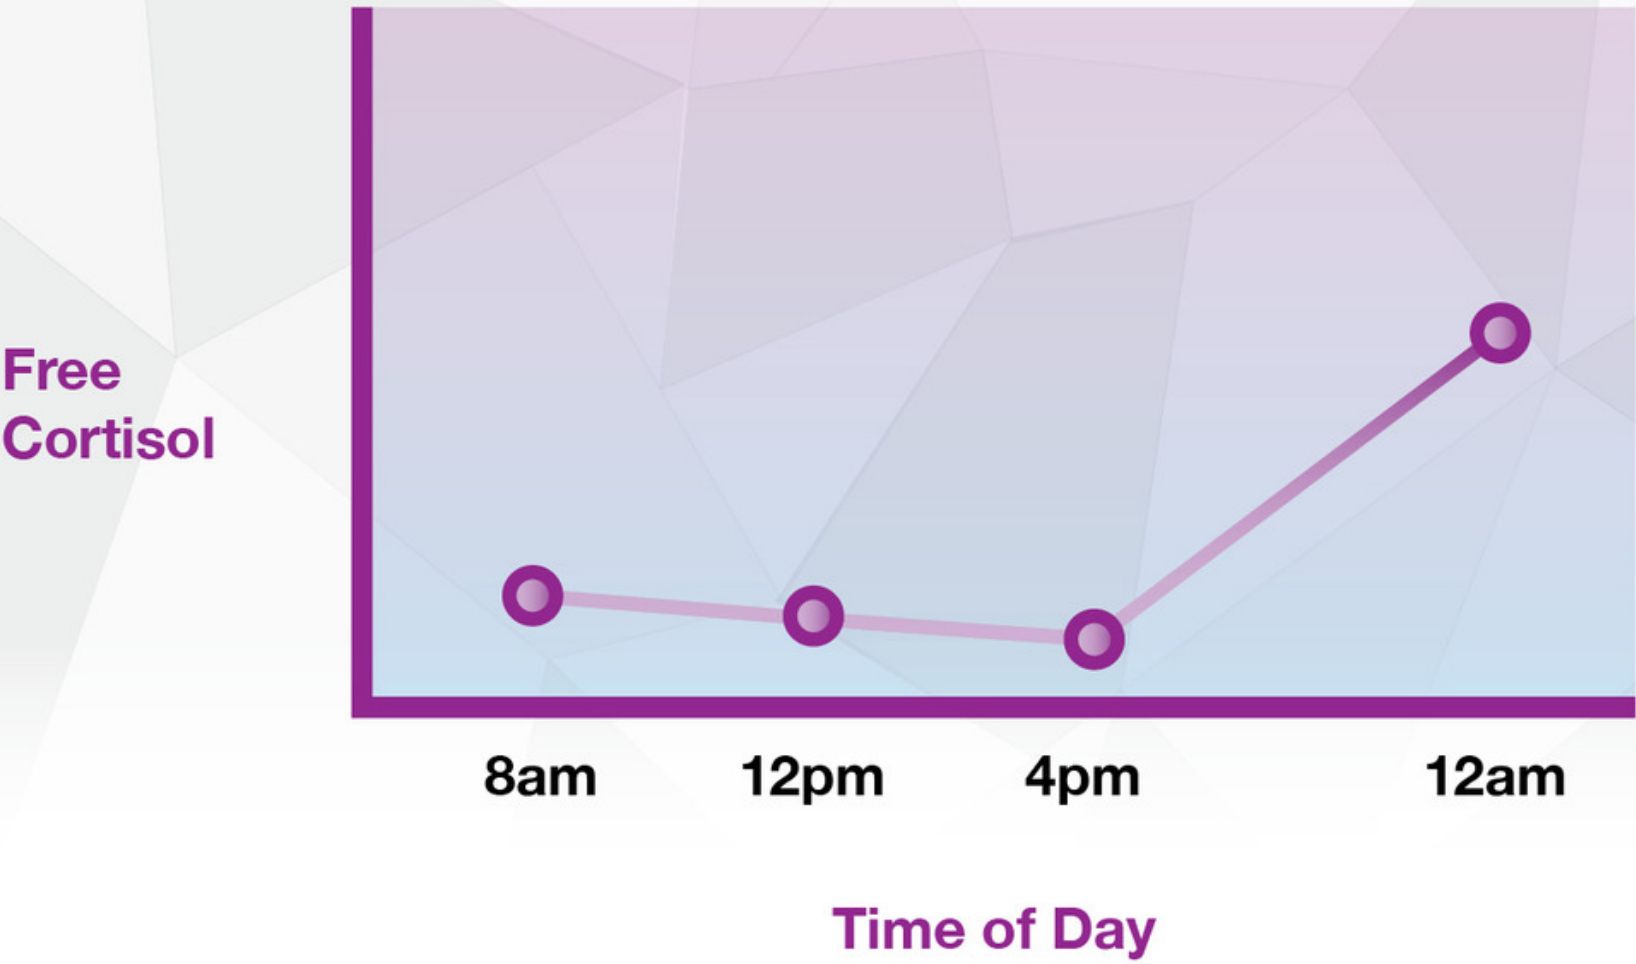

As you can see, high cortisol and anxiety share many of the same symptoms. This is why high cortisol can directly cause anxiety.

And since most women with bad hormones have a serious cortisol problem, it's the reason why many of them also have anxiety.

One of the best things you can do to sleep better, fix your metabolism, and drastically reduce or eliminate anxiety when your hormones are bad...

Lower your cortisol!

## TYPE 1 - HIGH CORTISOL

# High Cortisol Causes A Sluggish Thyroid.

**MARTINCLINIC.COM**

Hey, It's Dr. Martin here...

I want to quickly share with you how high cortisol can DIRECTLY affect your thyroid.

In fact...

High cortisol can slow your thyroid down and cause hypothyroidism.

Here's how:

Remember, your thyroid gland only does what it is told to do by your **hypothalamus**.

But not only that...

There's also a 'middleman' between your hypothalamus and thyroid...

Called your **pituitary gland**.

Your hypothalamus tells your pituitary to get your thyroid going.

Once your thyroid gets going...

It makes **FOUR important hormones** you need to be healthy.

The four hormones are T1, T2, T3, and T4.

But...all you need to know is T3 is a powerful metabolism regulator. It's the ACTIVE form.

You need T3 to function.

You need T3 for energy.

You need T3 to lose fat...

On the other hand...T4 is the inactive form.

You get the idea.

But...here's the problem.

90% of the hormones produced by your thyroid comes in the form of T4.

Your body needs to take the T4 and convert it into T3.

And this is where high cortisol can ruin your thyroid.

Cortisol directly REDUCES the conversion of T4 into T3.

Which is why high cortisol can lead to a sluggish thyroid.

It’s also why many women who have adrenal symptoms eventually end up with sluggish thyroid symptoms as well.

You need healthy cortisol levels in order to have a normal functioning thyroid.

Talk soon,
