Top 3 Causes Of Brain Inflammation

MARTINCLINIC.COM

Hey, It's Dr. Martin here...

Thanks for requesting our best newsletters about Alzheimer's and dementia.

Enjoy!

One of the BIG concerns that we hear about in our clinic or by email has to do with dementia and Alzheimer's.

They are both terrible diseases...

AND they are BOTH preventable a majority of the time.

That's what really frustrates me with the current 'health' care system.

They are looking for DRUGS to treat rather than CAUSES to prevent.

Well...

The good thing is that the past two years have really connected some of the dots when it comes to dementia and Alzheimer's causes.

For example...

A study published a few weeks ago has concluded that...

INFLAMMATION drives the progression of Alzheimer's.

The researchers found that inflammation may hold the key to tackling Alzheimer's before symptoms even start.

This is BIG news. It's also consistent with what I've been saying for a long time.

Here's the thing to remember...

Inflammation doesn't just magically appear.

If inflammation is a CAUSE of Alzheimer's...

What causes inflammation?

In my opinion...

The THREE big causes of brain inflammation are...

Leaky Gut Syndrome.
High Circulation Insulin Syndrome
Free Radical Damage.

The good news is that all three of them are COMPLETELY treatable and preventable.

We are almost finished with a new home program on fixing leaky gut. It's a game changer.

We also recently recorded a presentation that we did on getting a healthy gut that I'll share with you shortly.

When it comes to fixing or preventing High Circulating Insulin Syndrome then the key is keeping insulin low and reversing or preventing insulin resistance.

That's the premise behind our Serial Killers Revisited Program.

Then there's the free radical issue.

That where NAVITOL comes in.

Navitol is a POWERFUL antioxidant. There is nothing like it.

The main ingredient, Pine Bark Extract, is also one of the few nutrients that can cross the blood brain barrier.

This is why NAVITOL is so good at protecting the brain.

Other brain supplements like ginkgo don't cross the blood brain barrier that well.

Let me say one more thing about the brain and then I'll wrap up this email.

One of the effects that inflammation has on the brain is causing it to shrink.

Not only does your brain shrink while you age...

Many things can cause it to shrink faster and this can also be very bad news for our brain.

How To Age-Proof Your Brain.

MARTINCLINIC.COM

Get my FREE How To Age-Proof Your Brain Video

Hey, I'd like to invite you to a FREE online webinar where I'll show you How To Age-Proof Your Brain.

In the FREE webinar I'll share...

The three CAUSES of brain inflammation that can lead to Dementia and Alzheimers.
The main common deficiencies that hurt your brain.
The EXACT plan we use in our clinic to help protect brain function.

Simply [click here](#) to learn more.

This on-demand training is crucial if you're worried about your brain as you age.

This Causes HALF Of
Alzheimer's Or Dementia
Cases.

MARTINCLINIC.COM

Hey, It's Dr. Martin here...

Confirmation isn't boring.

It is amazing how many studies are coming out showing the effect that insulin resistance has on the brain.

Here's another one...

A study published in March 2017 showed...

...insulin resistance leads to faster cognitive decline.

Now this isn't the first study to show this and definitely won't be the last.

What's interesting about this study is where it was published...

...The Journal of Alzheimer's Disease.

What I also found interesting about this study was...

that cognitive decline was seen in BOTH diabetic and non-diabetic subjects...

once again showing that diabetes is a disease of insulin resistance...

and if you have insulin resistance and yet have not been officially diagnosed with diabetes, you are still at risk.

Let me quickly recap a few of the BIG reasons why so many are ending up with dementia or Alzheimer's...

First....

as I just discussed, insulin resistance is a HUGE reason why so many people will end up with dementia or Alzheimer's.

Insulin resistance affects a lot of people which means that a lot of people are at risk.

We call Alzheimer's...

Type-3 Diabetes.

Essentially the brain becomes diabetic and dementia is one of the symptoms.

This is VITAL to understand.

Insulin resistance affects everyone differently.

...some become obese and diabetic.
...some get high blood pressure.
...some get fatty liver.
...some get skin problems.
...some get dementia and Alzheimer's.
...some heart disease.
...some get kidney issues.
...some get digestive disorders.

and... some get all the above.

The point is...

even if you are not overweight, but still have chronically elevated insulin levels, you may still end up with brain problems.

Another problem with insulin resistance is that it leads to FASTER brain shrinkage.

This isn't good.

Our brains naturally shrink as we age, and dementia is associated with smaller brains as well.

There are a few things that causes our brains to shrink faster, like smoking for example.

But, high blood pressure is another cause...

and...

so is insulin resistance.

BUT, high blood pressure is just a symptom of INSULIN RESISTANCE.

As you can see...

insulin resistance is BAD for your brain.

Want to protect your brain?

...FIX insulin resistance
...get enough DHA
...take a powerful antioxidant (NAVITOL)
...get enough B12
...add some curcumin or turmeric.

....and lift weights/HIIT.

Your Brain Shrinks As You Age.

MARTINCLINIC.COM

Hey, It's Dr. Martin here...

I'd like to talk about brain SHRINKAGE.

sounds scary doesn't it?

the "official" name is cerebral atrophy and...

it's actually much more common than you think.

In fact...

in the past we've talked about the three main things that you have to watch out for if you want to have a healthy brain...

or age with a healthy brain...

and brain shrinkage was one of them.

when your brain shrinks you lose neurons and the connections between them.

no bueno.

If your brain starts to shrink you are definitely at risk for things like dementia and Alzheimer's.

Now...

there are four things that will shrink your brain.

If you have high blood pressure...

you are at risk for cerebral atrophy.

quick question...

what causes high blood pressure?

Answer: INSULIN

If you smoke...

your brain WILL shrink.

If you are overweight or obese...

there is a good chance that your brain is shrinking.

What is the cause of obesity?

Answer: INSULIN

If you have diabetes (type-2)...

your brain will shrink.

What causes Type-2 Diabetes?

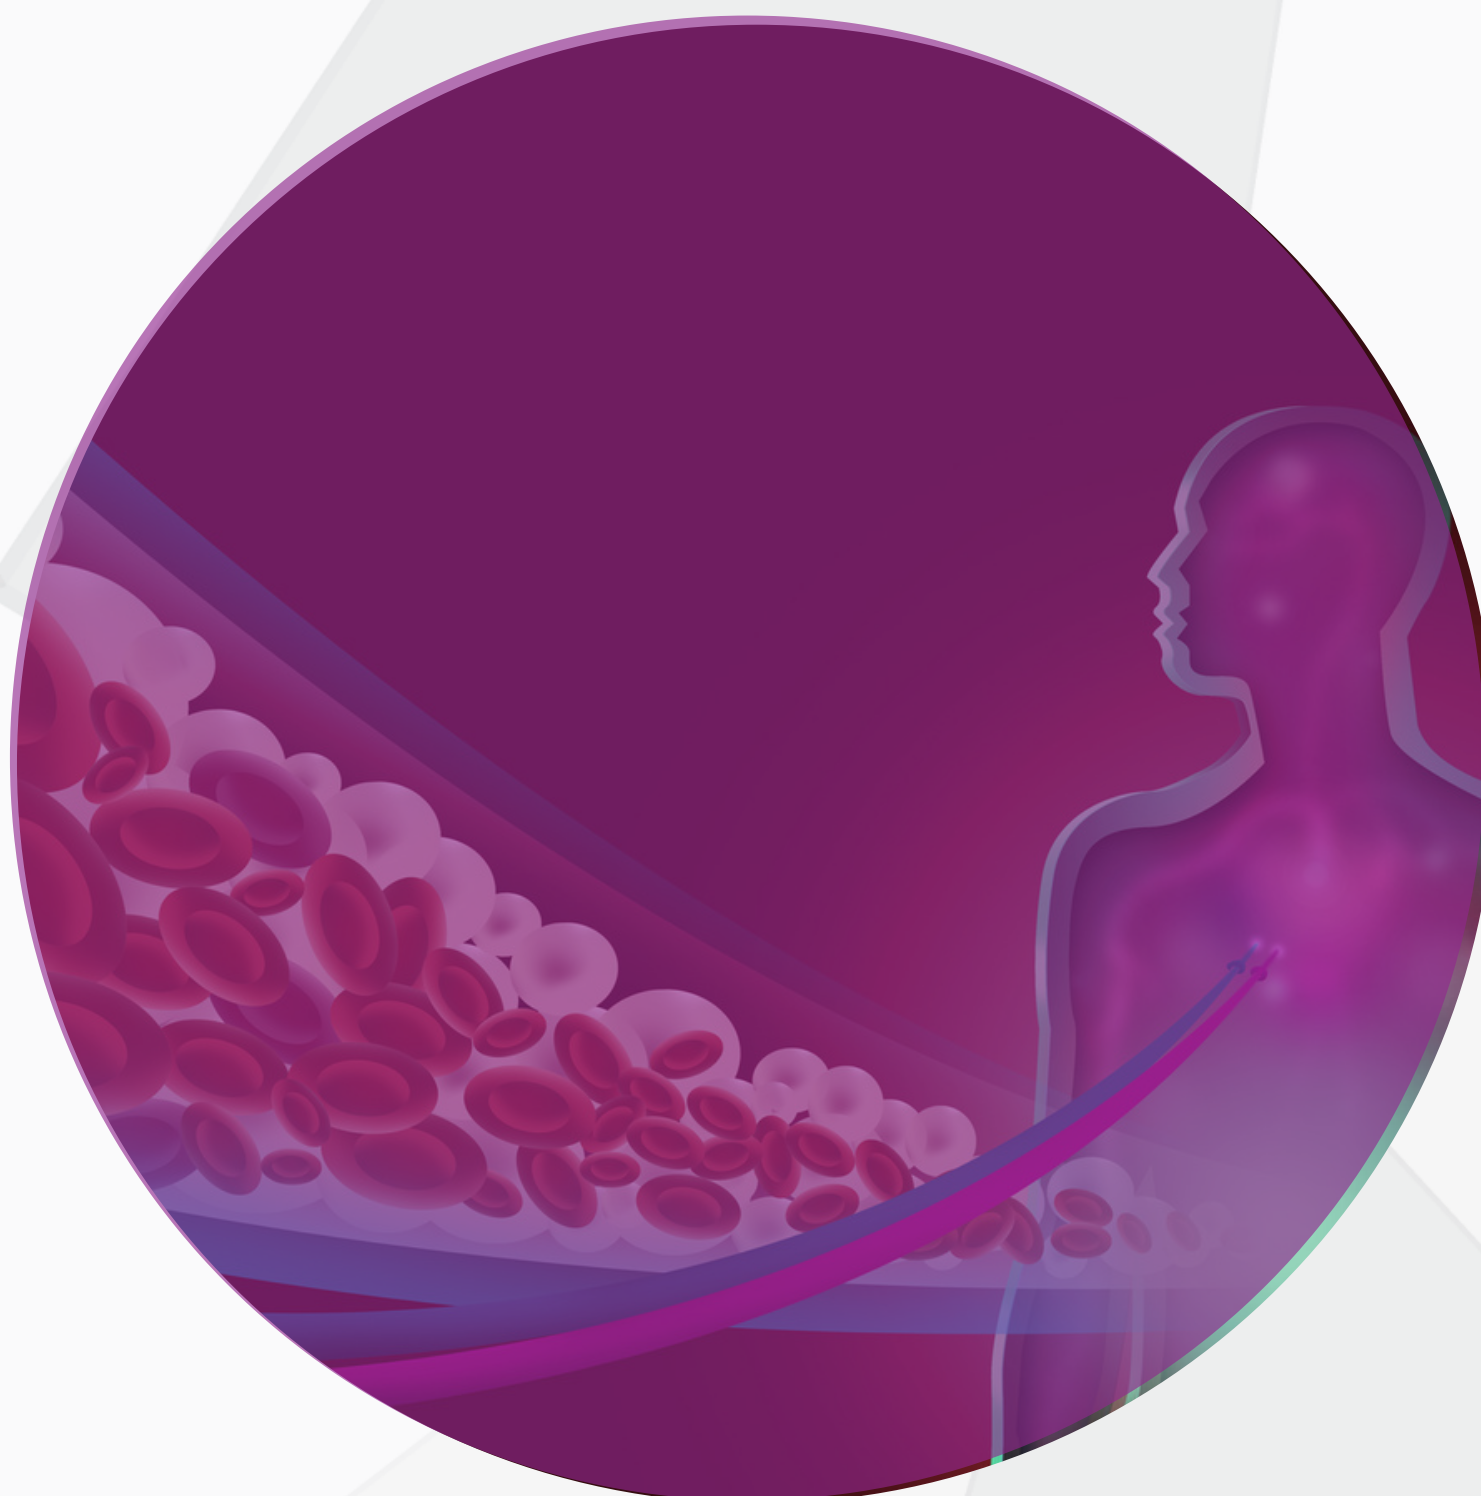

Answer: INSULIN resistance.

THREE OUT OF FOUR of the causes of brain shrinkage has to do with INSULIN.

control your insulin and don't smoke...

there is a better than good chance that you will age with a healthy brain.

Healthy Brain.

MARTINCLINIC.COM

Hey it's Dr. Martin here...

I have a saying about the body that I use in my clinic...

"if you don't use it, you lose it."

For many things, that's how the body works.

AND when you add aging to the mix, it can become a double-whammy.

For example...

Let's look at our muscles.

Every year after the age of 30, we naturally start to lose a little bit of lean muscle mass every year.

This is normal.

This means that we have to work harder to put on and keep muscle.

Now...

Imagine the average person over 30 who doesn't lift weights or consume enough protein...

Because they aren't using it, they are losing it PLUS they are losing a little bit every year because of age.

A double-whammy.

The same thing happens to our brain, but potentially MUCH worse.

Your brains demands a lot of energy. It is an energy hog.

In order to meet the energy demands...

Glucose is allowed to travel freely across the blood-brain barrier and enter the brain cells WITHOUT insulin.

BUT...

The brain may not need insulin to help get glucose into the brain cells, BUT it needs insulin to help process the glucose.

Insulin is VITAL for brain cells to help transform glucose into what it needs to function properly.

When you have the right amount of glucose and insulin, your brain is functioning like a well oiled machine.

BUT...

If you are like a LOT of people who have insulin resistance...

Your brain is in BIG trouble.

When you are insulin resistant, your brain cells aren't getting enough insulin inside the cells even though you have HIGH circulating insulin.

Without the insulin, your brain can't get the energy it needs.

AND without the energy, your brain starts to shrink.

Here's the BIG problem.

The area of your brain responsible for memory is called your hippocampus.

AND research is showing that this is the area that really takes a beating when you are insulin resistant.

Why?

The hippocampus requires a LOT of energy.

When you are insulin resistant your hippocampus cells aren't able to process glucose to get the energy it needs

AND this causes the hippocampus to work a lot less.

Think of what that does to your memory.

Now... What happens when you don't use something?

The same thing happens to your hippocampus. It SHRINKS.

Not only does our brain naturally shrink with age...

It will also shrink much faster if you are insulin resistant.

The BEST thing that you can do for your brain is lower your insulin.

Talk soon,

My First Apartment And Your Brain.

MARTINCLINIC.COM

Hey, It's Dr. Martin here...

I remember my first apartment...

It was a small, one bedroom basement apartment.

I was newly married...

And was just starting postgraduate studies.

After about a year of living there, the building was sold to a new owner...

And let's just say the new owner didn't do much for the building...

In fact...

It was the first time that I heard the term slumlord.

The new owner didn't live in the building...

And he was only concerned about maximizing profit by not spending any money on property maintenance.

One weekend in July, some friends of ours were getting married....

So... My wife and I left the apartment for the weekend.

When we came back from the wedding, and walked down the stairs and into our apartment...

We were greeted with the absolute worst, foul smelling odour we've had ever experienced.

We quickly realized there had been a sewage backup...

And since our apartment was in the basement...

We got the worst of it.

It was bad.

We later found out that the new owner was told there was a major problem with the building's plumbing...

But obviously he didn't do anything about it...

And our stuff paid the price for it.

Here's why I'm sharing this story with you...

Did you know the average brain weighs about 3 pounds?

That's only about 2% of the average adult body weight.

Yet...

Brain cells consume 25% of the body's total energy.

2% of your body weight consumes 25% of your energy...That's incredible.

The bottom line is...

Your brain uses a LOT of energy.

One of the bi-products of using so much energy is WASTE...

Specifically toxic proteins and biological debris.

When the rest of your body makes energy it also creates a lot of waste.

That's where your excretory system (sweat glands, liver, lungs and kidney system) comes into play.

But what about your brain?

What happens to the waste created while it's making energy?

In order for you to survive and have a healthy brain...

Your brain needs a way to flush out junk, and do a good job of it....

Otherwise you end up with Alzheimer's, Parkinson's, and other brain diseases.

Now...

You may be surprised to learn the brain's plumbing system has been a mystery...

Researchers knew there was a plumbing system, but didn't know anything about it...

Until recently.

Scientists have just discovered a new system...

Called the glymphatic system...

And this system literally drains waste from your brain. It's your brain's plumbing system.

Here's the whole point:

The activity of the glymphatic system **DOUBLES** when you're sleeping.

This partly explains why good sleep habits protect against dementia and Alzheimer's.

If you're not sleeping well...

Then the waste from your brain isn't draining properly.

And just like my first apartment...

The waste will backup into your brain and put you at serious risk of Alzheimer's and dementia.

It's time to **FIX** your sleep.

Talk soon,
