The Most Important Question
Your Doctor Should Ask You.

MARTINCLINIC.COM

Hey, It's Dr. Martin here...

Thanks for requesting our best newsletters about the thyroid.

Here's the first one:

One of my BIGGEST pet peeves is healthcare has lost the ART of medicine.

What do I mean by that?

I'll use the thyroid as an example to explain what I mean.

(By the way, this scenario is VERY common)

Meet Jane.

She's Tired.

She's not sleeping well.

She's gaining weight and can't seem to lose it no matter what she does.

She's also noticed that her hair is falling out a little more than before, her nails are weak, and even her eyebrows seem thinner.

After doing a little bit of research...

She's convinced that her thyroid is sluggish, and decides to make an appointment to see her family doctor.

Her doctor orders some blood tests and they come back somewhat normal. Nothing to really explain all of her symptoms.

"Your thyroid is OK" her doctor says.

"But I have a lot of hypothyroid symptoms" Jane replies.

"Your blood work is good. It isn't your thyroid. Have you been feeling depressed lately?"

This doctor has lost the ART of medicine...

AND now practices lab based medicine only.

Lab based medicine only focuses on numbers. That's it.

If the lab numbers are good...

You're healthy...

No matter how you feel.

This type of medicine is much easier and quicker.

It used to be that you would treat symptoms until the symptoms improved.

The TSH test for the thyroid was only invented in 1975.

Before that, patients were treated for thyroid based on their symptoms.

Here's a fact about the thyroid:

Subclinical hypothyroidism can exist 7 YEARS before lab numbers are affected.

You can have thyroid symptoms for 7 years before they show up on blood testing.

7 years of fatigue.

7 years of weight gain.

7 years of poor sleep.

Should you have to suffer with these symptoms for that long, just waiting for your numbers to change?

It sounds ridiculous doesn't it?

But that’s what many women experience when their thyroid starts to slow down.

The #1 question that a doctor should be asking you is...

How do you FEEL?

That’s all that matters.

Who really cares what the numbers say?

Talk soon,

P.S. Our THYROID BALANCE FORMULA was created to naturally support your thyroid.

Does it work?

positive results

My GP would not increase my low thyroid meds. Dr. Martin's Thyroid Balance Formula seems to be the extra boost my thyroid needed. I have been taking them for a couple of months and I am waking earlier, and feeling more energized during the day.

Thyroid helper

This is an amazing product! It has really helped to balance my Thyroid issue.....much better than the Desiccated Thyroid that alternative medical professionals prescribed me!

Thyroid Blessing

4 months ago had high levels of tsh. Was put on low dose medication. Had symptoms of dry hair, dry cough, tight chest, heart palpitations, joint pain, gut pain and swelling weight gain. A month on the pill and symptoms reduced but not feeling good still. Go back for blood work and shows normal. Began taking Thyroid balance only 2 a day a month ago and with in the few days all my symptoms went away. I now have energy, strong nails, no joint pain, no dry cough, lost weight, bowels and gut regular, healthy hair.
A blessing for me.
Thanks for the Dr. Martin Clinic. and team for supporting me with all my questions through your chat and emails. I'm back on track again.
Thanks

How To Overcome Thyroid Issues.

How to **Overcome**
Thyroid Issues
Video

Hey, I'd like to invite you to a FREE online webinar where I'll show you How To Overcome Thyroid Issues.

In the FREE webinar I'll share...

The big reasons why thyroid testing doesn't actually work for a majority of people with sluggish thyroids.

The main causes of hypothyroidism.

Our exact protocol we've used in our clinic to help thousands of people overcome thyroid issues.

Here's Why You Can Have
Symptoms And Still Have
Normal Blood Tests.

Hey, It's Dr. Martin here...

In the last email I talked about how healthcare has lost the art of medicine and has gone full out lab based medicine now.

No matter how you feel...

If your lab numbers are good...

You're healthy.

I also mentioned that...

Subclinical hypothyroidism can exist 7 YEARS before lab numbers are affected.

You can have thyroid symptoms for 7 years before they show up on blood testing.

7 years of fatigue.

7 years of weight gain.

7 years of poor sleep.

How can that be?

How can it take so long for blood numbers to change?

It's because of...

RECEPTOR SITE SENSITIVITY.

Here's what I mean by that...

Every cell in your body has various receptors for the different hormones you make.

Your cell receptors are like mini-antennas...

And they transmit the signal from outside of the cell to the inside of the cell.

For ANY hormone to work, your receptors have to pick up the hormone signal and pass the info into the cell.

What happens if your receptors aren't working properly?

When this happens...

You can have a normal amount of a hormone circulating in your blood...

But the hormone isn't having the same affect on your cells as they should be.

This is a big reason why you can have all the symptoms of a sluggish thyroid and still have normal blood tests.

You have enough of the hormone (for now)...

But the hormone isn't having the same effect on your cells.

How does that happen?

Why do some of your receptors stop working as well?

To be honest...

There's a lot of reasons.

But a BIG one is inflammation.

When you have inflammation your cell receptors don't work as well. They become stressed.

Lowering inflammation is a BIG part of getting better.

But remember.

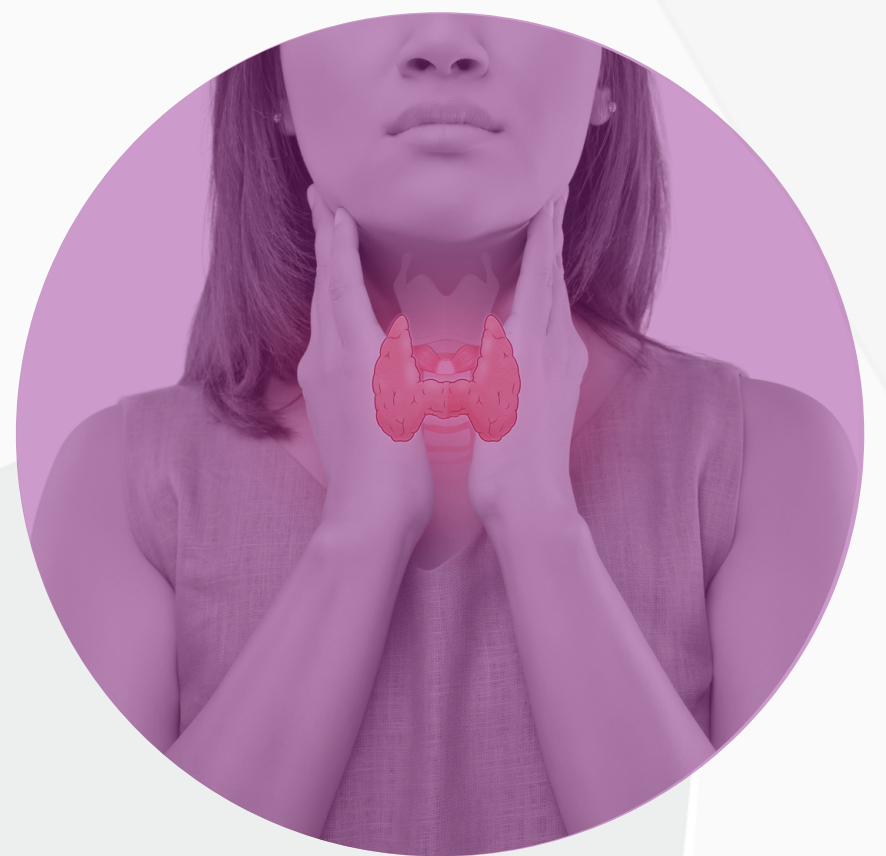

Inflammation isn't Houdini, it doesn't just magically appear. SOMETHING has to cause the inflammation.

For many men and women...

A BIG cause of inflammation is STRESS...

Which causes HIGH CORTISOL.

When you have high cortisol, you also have high inflammation.

Let me quickly come back to the thyroid.

Can your thyroid problems be caused by HIGH CORTISOL?

Yup.

High cortisol can cause inflammation which hurts your cells ability to be influenced by thyroid hormones.

This is a main cause of the Metabolic Storm that we talk so much about.

Talk soon,

Surprising FACT About The
Thyroid Your Doctor Doesn't
Even Know.

Hey, It's Dr. Martin here...

Did you know that Ricin is one of the most (possibly the most) deadly poisons?

A dose the size of a SINGLE grain of sand is enough to kill you.

Imagine a dosage that small being so deadly.

That's how powerful of a poison it is.

Now...

Over the years I've called the thyroid...the 'master' gland.

It has a massive influence directly or indirectly on EVERY cell in your body.

You need a healthy thyroid to have energy...

To maintain a healthy weight...

To regulate your body temperature...

To keep your skin healthy...

To keep your hair healthy...

Even your brain needs a normal functioning thyroid.

Here's the thing...

Your thyroid is tiny.

It weighs less than 25 grams.

Yet it's extremely powerful.

It's so strong...

Your thyroid gland only secretes about 1 TEASPOON of thyroid hormone over a full YEAR.

One teaspoon...that's it!

Can you see why it's virtually impossible to test properly?

The slightest decrease in thyroid hormone production will devastate your body.

A microscopic change can cause...

Hair loss
Fatigue
Exhaustion
Weight Gain
Cold hands/feet
Depression
Dry Skin
Muscle cramps
Poor memory
Constipation

This is why...

The absolute BEST 'test' for thyroid is still SYMPTOMS.

How do YOU FEEL?

Ask yourself...

When was the last time you felt FANTASTIC?

If you have thyroid symptoms...then your thyroid is a PROBLEM.

It really doesn't matter what the tests say.

Thankfully...

Hormones, even your thyroid...can be fixed.

Your symptoms can go away.

Talk soon,

P.S. As I've said before...

Most women who have hormonal problems, including thyroid, usually have a problem with the Bermuda Triangle of hormones...

The adrenals (cortisol)
The Ovaries (Estrogen)
The Thyroid

It's not too often the problem is just with the thyroid...or adrenals...or ovaries.

All three are involved.

Sometimes the thyroid is more involved than the other two...

But they're still involved.

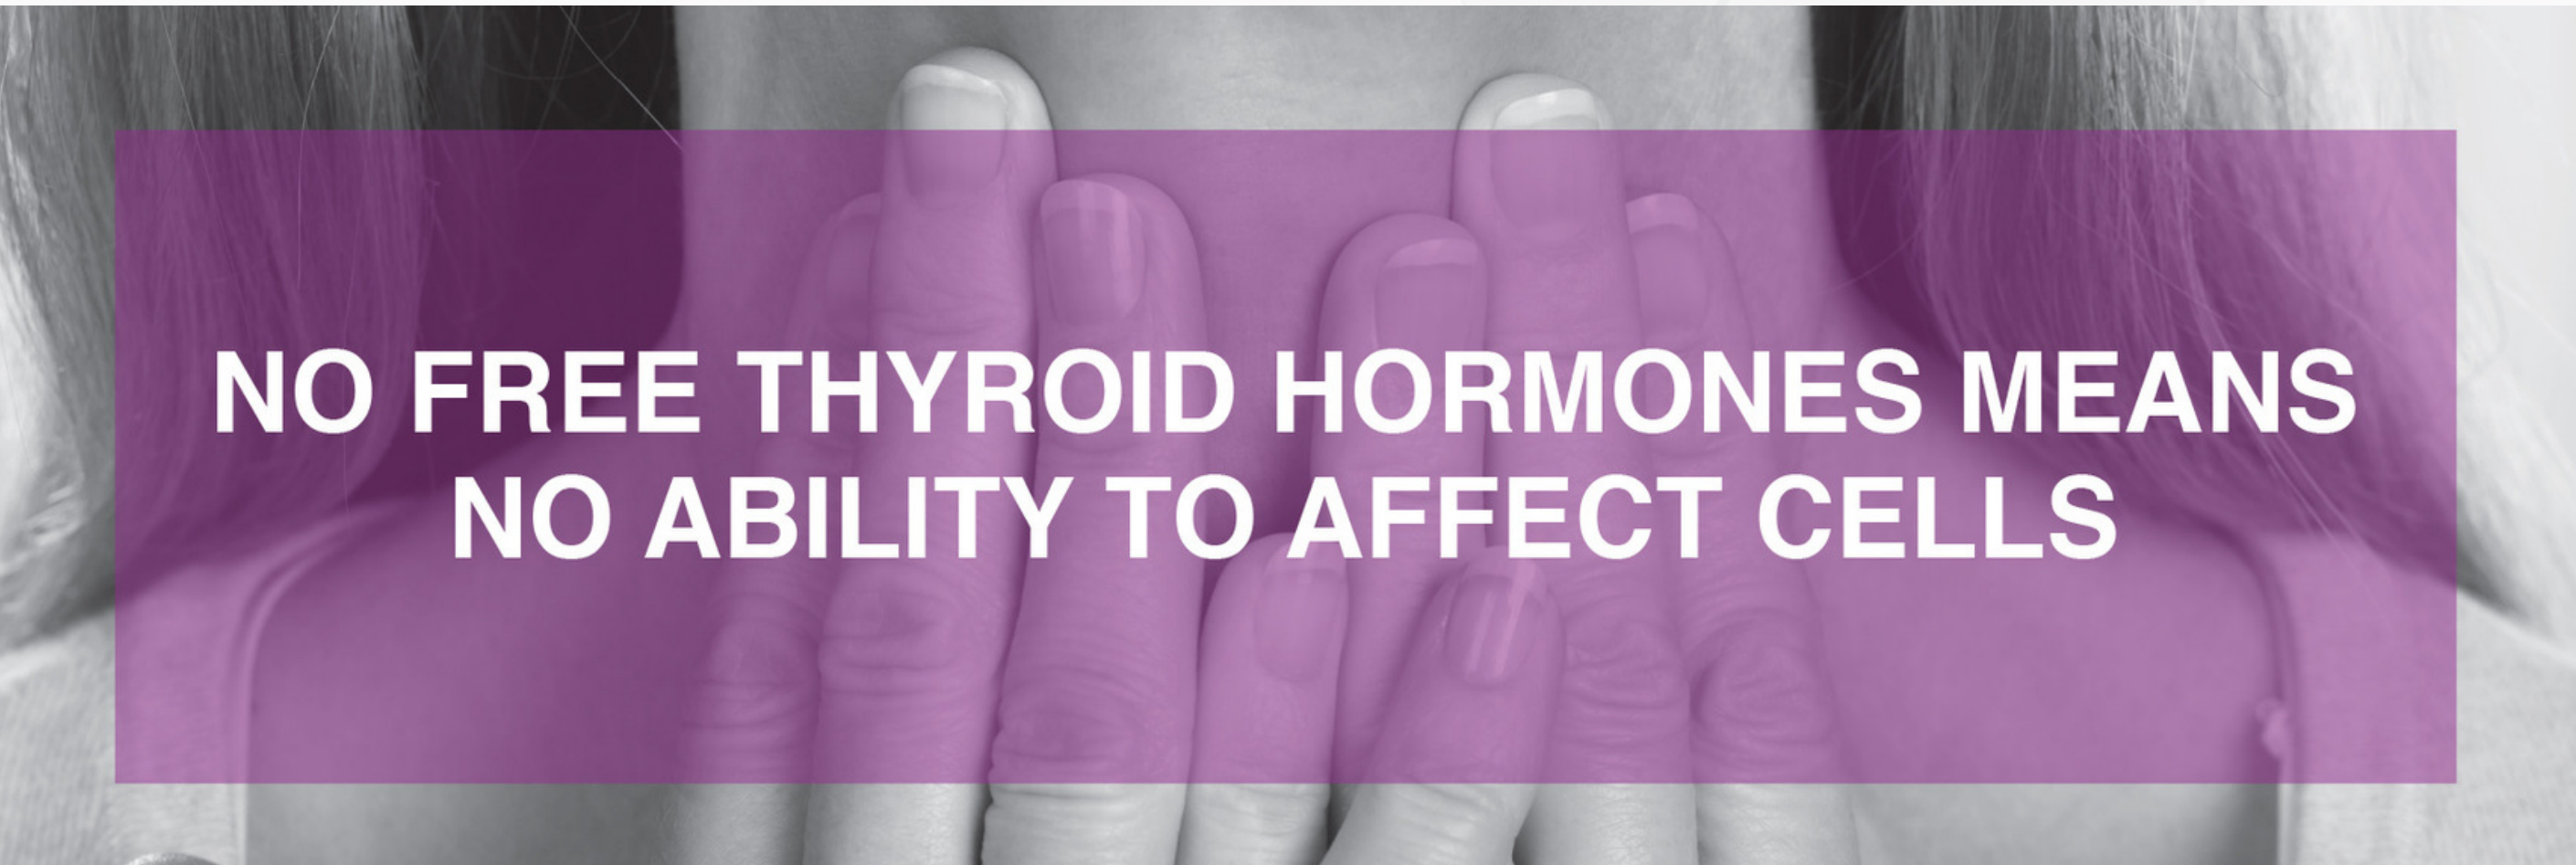

It's the way they're connected.

When one of them doesn't work properly...it drags the others with them.

My approach to fixing hormones is simple...

Fix the Bermuda Triangle of Hormones.

When that's fixed...it's amazing how much better a person feels.

**NO FREE THYROID HORMONES MEANS
NO ABILITY TO AFFECT CELLS**

How Stress KILLS Your Thyroid.

[MARTINCLINIC.COM](https://martinclinic.com)

Hey, It's Dr. Martin here...

I want to quickly share with you how high cortisol can DIRECTLY affect your thyroid.

In fact...

High cortisol can slow your thyroid down and cause hypothyroidism.

Here's how:

Remember, your thyroid gland only does what it is told to do by your **hypothalamus**.

But not only that...

There's also a 'middleman' between your hypothalamus and thyroid...

Called your **pituitary gland**.

Your hypothalamus tells your pituitary to get your thyroid going.

Once your thyroid gets going...

It makes **FOUR important hormones** you need to be healthy.

The four hormones are T1, T2, T3, and T4.

But...all you need to know is **T3 is a powerful metabolism regulator**. It's the **ACTIVE** form.

You need T3 to function.

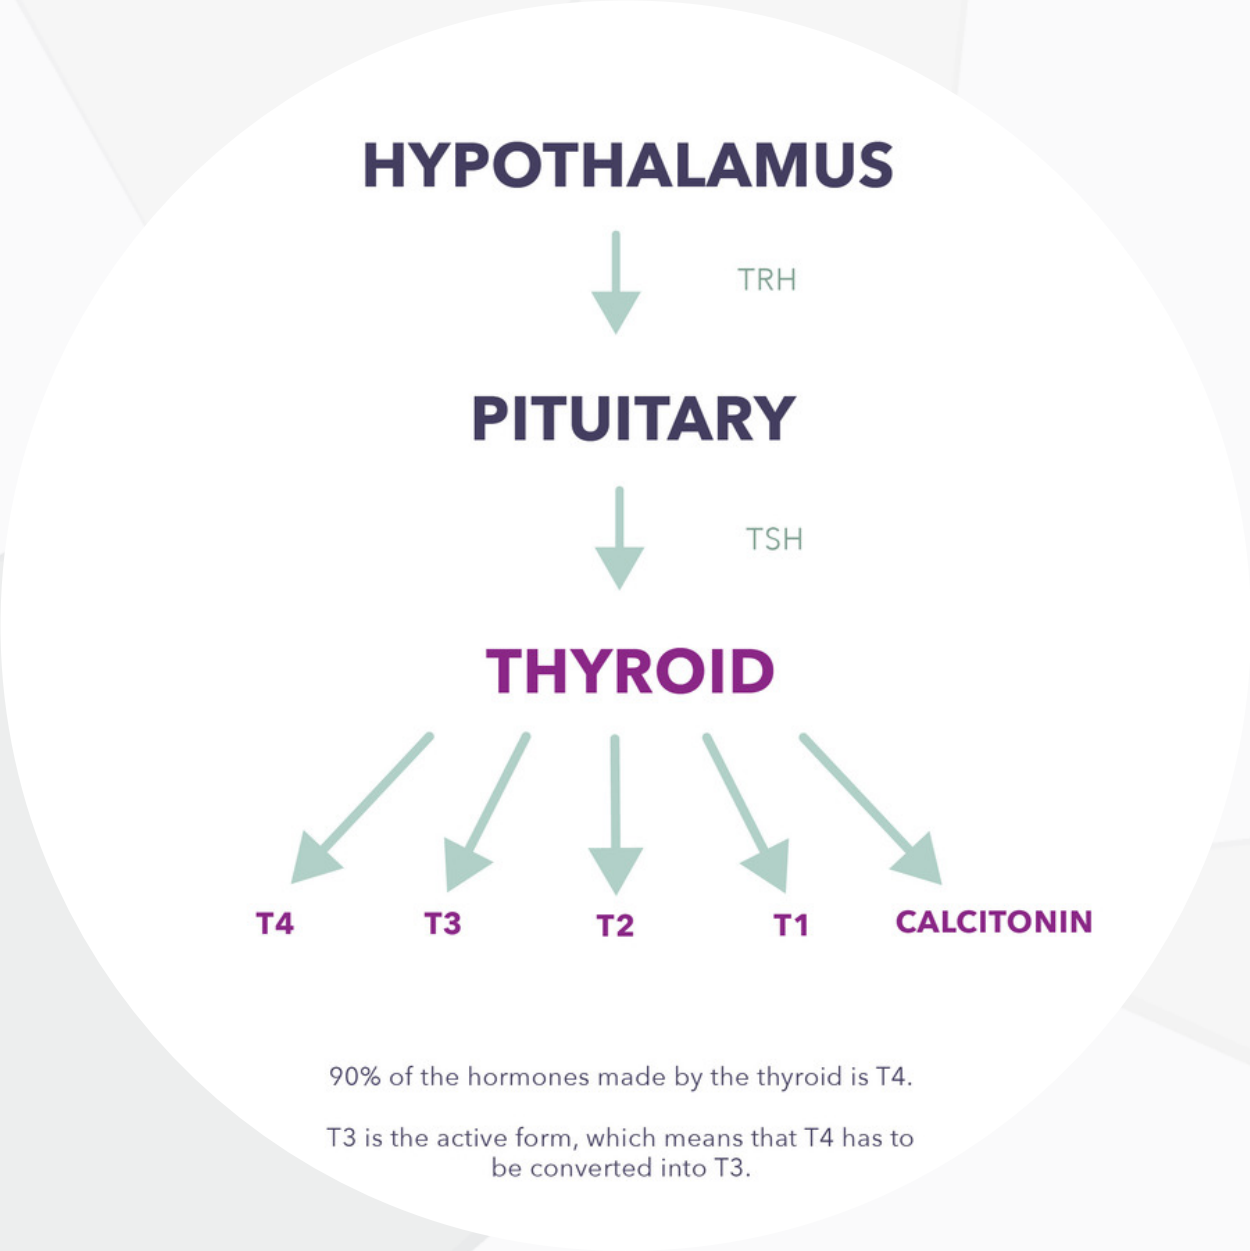

You need T3 for energy.

You need T3 to lose fat...

On the other hand...T4 is the inactive form.

You get the idea.

But...here's the problem.

90% of the hormones produced by your thyroid comes in the form of T4.

Your body needs to take the T4 and convert it into T3.

And this is where high cortisol can ruin your thyroid.

Cortisol directly **REDUCES** the conversion of T4 into T3.

Which is why high cortisol can lead to a sluggish thyroid.

It's also why many women who have adrenal symptoms eventually end up with sluggish thyroid symptoms as well.

You need healthy cortisol levels in order to have a normal functioning thyroid.
