

URGENT!

**SIX OVERLOOKED
YET PROVEN CAUSES OF**

LEAKY GUT SYNDROME

You have TRILLIONS of bacterial organisms that live inside your body called the MICROBIOME.

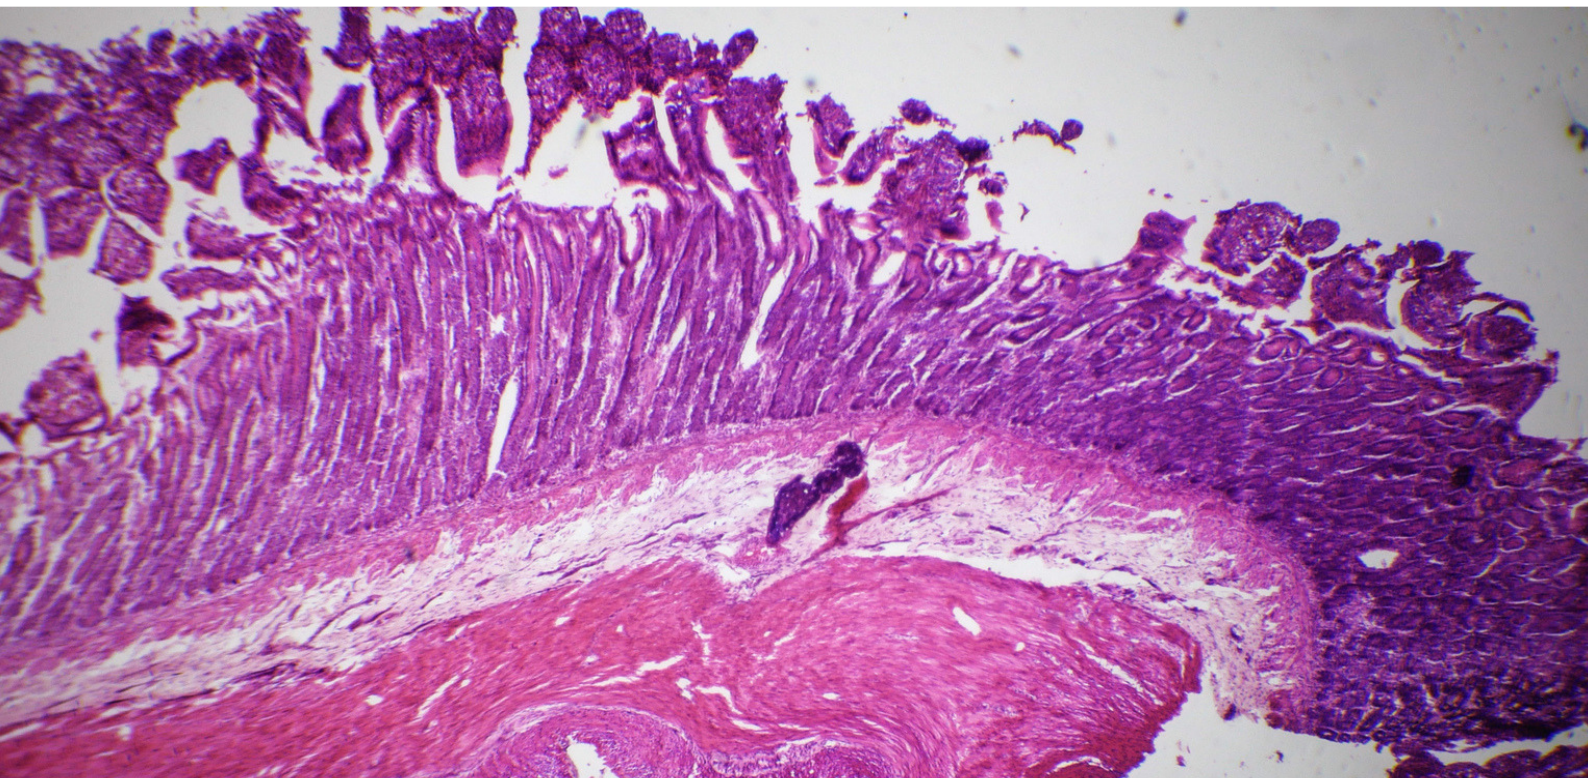

Your microbiome can be found everywhere throughout your body, but a majority of them are found in your gut.

Your microbiome is so important to your health that most consider it another organ.

Why would researchers consider it as another organ?

Well...

Without your microbiome you'd be dead.

When your microbiome isn't *healthy you can get symptoms anywhere in your body.*

For example, you can get:

Joint pain	Auto-immune disorders
Eczema	Hair loss
Hives	Adult acne
Low Energy	Memory Loss
Fatigue	Dementia
Hormonal Imbalance	Alzheimer's
Digestive symptoms	Poor Sleep

Here's why...

When your microbiome isn't healthy then you end up with a condition called Leaky Gut Syndrome.

Now...

Leaky Gut Syndrome has to be one of the best named conditions because...

Your gut is literally leaking into your bloodstream!

This means that **bacteria, mold, candida, fungus, viruses, undigested food, or toxins can go from your gut to your bloodstream.** Once that happens, they could end up hurting any part of your body.

You may think that Leaky Gut Syndrome isn't that common...

But you'd be wrong.

Leaky Gut is extremely common.

In fact...

Most people today have some degree of it.

Why?

Because there are a LOT of things today that kill your microbiome.

You most likely already know that antibiotics are one of them.

They kill both bad AND good bacteria.

They don't care if the bacteria is actually good or bad for you...

They kill them all.

Which is both good and bad news for your health.

Obviously getting rid of the infection causing the bug is important, but when your good bacteria also gets killed in the process, your gut takes a hit as well.

Research has shown more than a 10-fold reduction in good bacteria after an antibiotic treatment.

It could take years to rebuild the gut bacteria after a prolonged use of antibiotics.

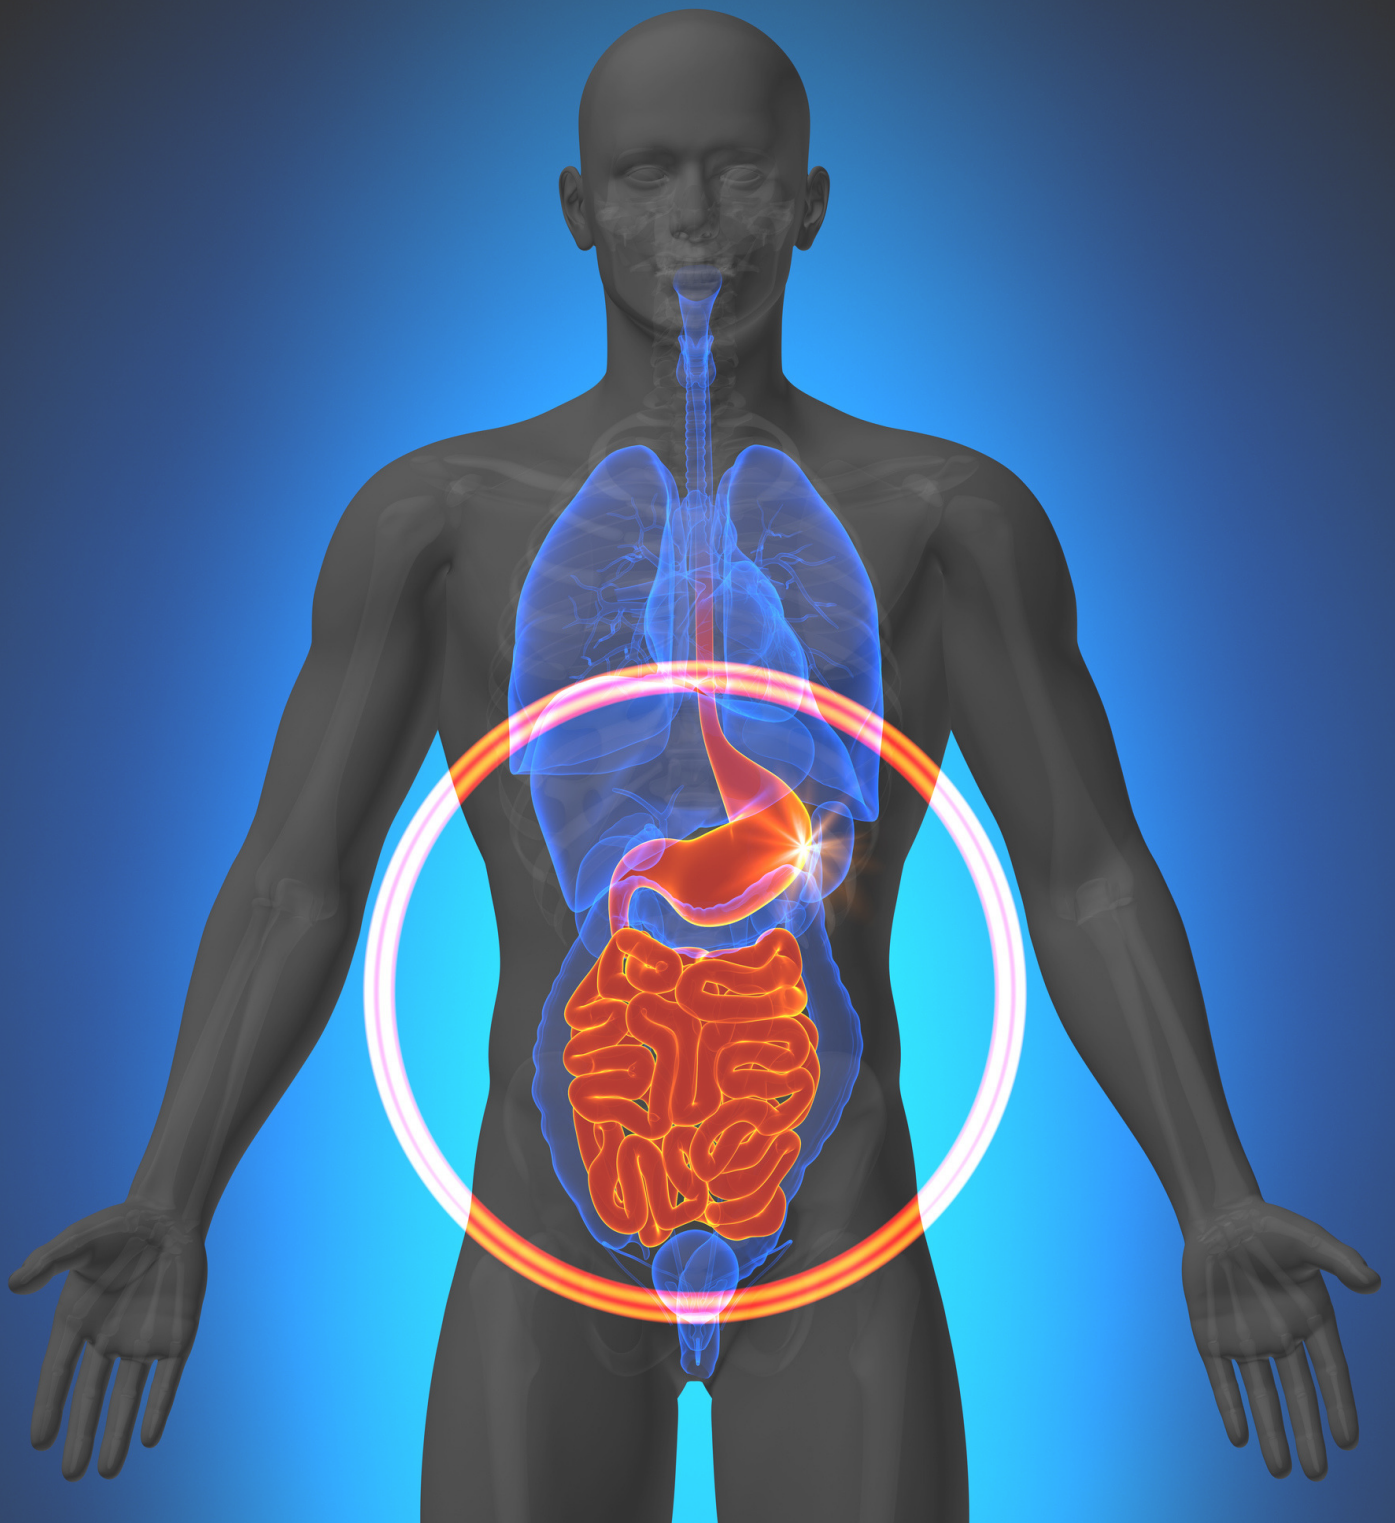

Which is why it is essential to be taking probiotics both during and after using antibiotics.

Aside from antibiotics...

there are SIX other common causes of Leaky Gut Syndrome that you need to be aware of.

Now...

The **SIX** everyday things that kill good bacteria **and cause** **Leaky Gut Syndrome....**

1. STRESS

When you're stressed, your digestive system isn't working properly.

That's a fact.

But did you know that **stress might be just as unhealthy as junk food to your gut?**

According to a study done by Brigham Young University, stress caused a change in the microbiome of the gut similar to that of junk food.

That's right.

Stress is just as hard on your gut as junk food.

We already know that stress causes elevated stress hormone Cortisol.

Cortisol causes inflammation of the gut and it irritates the gut lining leading to Leaky Gut Syndrome as well.

It turns out that stress directly alters the gut microbiome for the worse AND irritates the gut lining leading to damage...

2. ANTI-INFLAMMATORIES

NSAID's (non-steroidal anti-inflammatories) like Aspirin (Bayer, Bufferin, Excedrin), Ibuprofen (Advil, Motrin IB) and Naproxen (Aleve) can all alter your microbiome.

A 2016 study showed that bacteria in the gut changes based on the type of NSAID you are taking.

The study found that NSAIDs were particularly associated with distinct changes in your gut microbiome.

Every time you take a NSAID for pain or a headache, you alter your gut microbiome population....

3. VEGETABLE OILS

Vegetable oils...

(safflower, corn, soybean, sunflower, canola) are anything but healthy. **They cause inflammation, free radical damage, and hurt your gut.**

Studies have shown that **vegetable oils actually destroy the gut lining** which leads to increased leaky gut.

The proliferation of vegetable oil use is one of the biggest reasons for the explosion of autoimmune disorders as well as other chronic diseases.

4. PLASTICS

This is another BIG one.

.... We live in a plastic world.

Take this example from a headline in a major newspaper...

“Plastic pollution is so widespread that fibres are even found in household dust and the air we breathe”.

Not only is plastic in the air we breathe, it is found in almost all food.

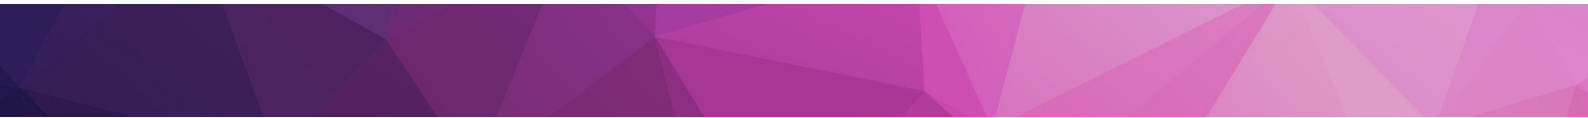

The point is...

Plastic is almost impossible to avoid.

One new study showed that 86% of the participants had the chemical plastic BPA in their urine.

BPA causes chronic inflammation and it also kills your good bacteria.

5. SWEETENERS

There are a LOT of non-caloric sweeteners available today.

Splenda and aspartame are two of the more common ones that are used by millions everyday.

When we evaluate sweeteners, we look for TWO things.

Does it elevate insulin?

Does it kill your good bacteria?

Non-caloric sweeteners don't affect your blood sugar which is why they're popular.

But, some of them **do affect insulin.**

And that matters.

Research is starting to show more and more that these popular sweeteners may not affect your blood sugar but **they do KILL your good bacteria...**

And that isn't good.

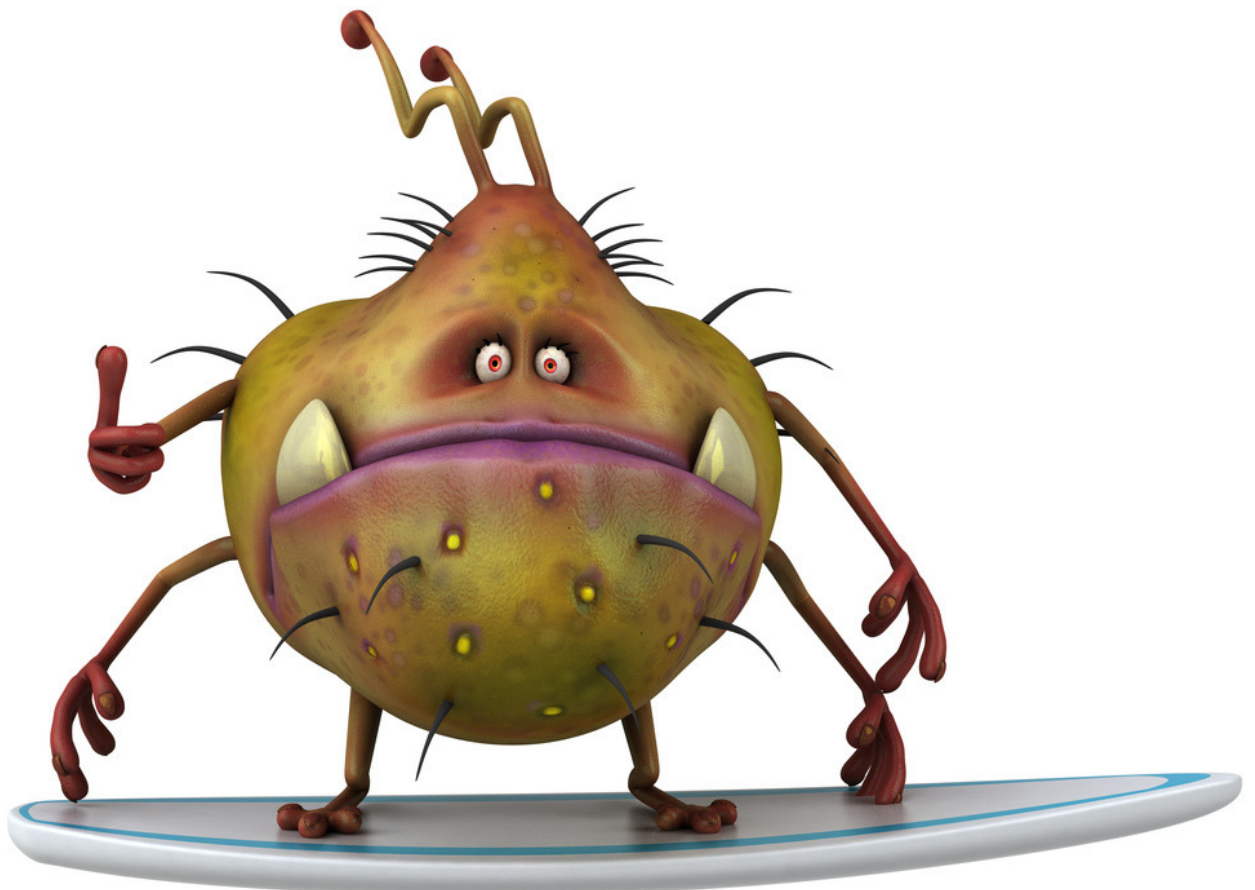

6. CHLORINE

Do you drink tap water?

How about using ice that was made with tap water?

If you do then there's a good chance that your gut bacteria has been hurt.

Studies have shown that chlorinated water kills your good bacteria and changes your microbiome for the worse.

There's a lot of other things that will kill your gut bacteria...

Which is why almost everything you do in a day kills your good bacteria.

If you are suffering from:

Joint pain

Eczema

Hives

Low Energy

Fatigue

Hormonal Imbalance

Digestive symptoms

Auto-immune disorders

Hair loss

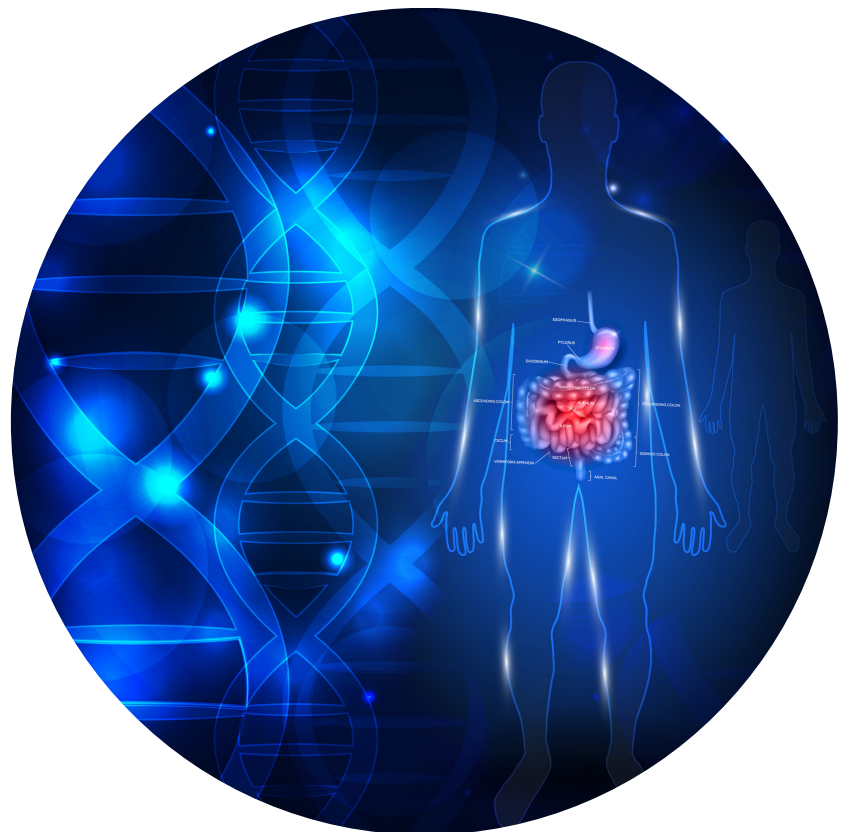

Adult acne

Memory Loss

Dementia

Alzheimer's

Poor Sleep

Then there's a good chance that your symptoms are due to Leaky Gut Syndrome.
