RECLAIM YOUR HEALTH WITH
VITAMIN B12

DON'T IGNORE LOW ENERGY

For 45+ years, I started nearly every conversation I had with new patients with some variation of this question:

"How's your ENERGY on a scale of 1-10?"

Why?

Because the answer to this question gave me good insight into what was happening with the patient.

One of the big problems with low energy is that apart from maybe looking a little tired, there isn't much that looks wrong with someone.

What I mean by that is...

If I were to separate my shoulder playing football...

Then, for the next 6 weeks, I would walk around with a shoulder sling. Anyone who sees me wearing a sling would know I was injured.

People would think, "That person has an injury."

But, someone with fatigue looks no different than everyone else.

So, friends and family have difficulty sympathizing with them...and may even think the problem is "all in their head."

Sadly, doctors are guilty of this as well. Unless something shows up in your blood work...

You're on your own.

That's why it's rare a day goes by...that we don't get someone who messages us on our website or Facebook, sends us an email, or even calls us because they're desperate for help.

They're exhausted and can't figure out what's happening.

I first tell patients to **NEVER ignore fatigue or low energy.**

Why?

Because low energy is like the check engine light in your car.

The problem with your car's check engine light indicator is that when it's on...

You have no idea what the issue is.

It could be a minor problem — you forgot to tighten the fuel cap after filling (I may or may not have done this in the past)...

Or it could be a significant issue — like the transmission is breaking.

The only way to know what's causing the check engine light to turn on...

Take your car to a mechanic so he can plug a device into your vehicle and diagnose the problem.

Well...your body kinda of works the same way.

You have many check engine lights.

One common check engine light in people is fatigue.

It's not normal to have low energy...especially to the point of fatigue.

Low energy is one way your body tells you something is going on.

But...the problem with low energy...like the check engine light...is that many things can cause low energy.

So...when someone struggles with low energy...it can be FRUSTRATING because, most of the time, doctors can't find anything wrong.

WARNING SIGNS

B-12 DEFICIENCY AFFECTS NEARLY **EVERY SYSTEM** OF OUR BODIES, THOUGH SYMPTOMS VARY BY PERSON.

DO SOME OF THESE SOUND FAMILIAR?

Cardiovascular system

- Fatigue
- Heart palpitations
- Shortness of breath

Digestive system

- Diarrhea
- Lump in throat
- Swollen, deeply creased tongue

Muscular system

- Clumsiness
- Muscle spasms and twitches
- Shaky hands
- Weakness

Nervous system

- Confusion, dementia
- Dizziness and balance problems
- Feeling faint
- Impotence
- Irritability or anxiety
- Memory loss and nominal aphasia (struggling to find the right word)
- Numbness, tingling, burning or other strange sensations in hands, arms, legs and feet
- Poor concentration

Visual/aural system

- Aversion to bright lights
- Tinnitus (ringing in the ears)
- Worsening vision

RISK FACTORS

Leading causes of B-12 deficiency include:

Abdominal surgery such as gastric bypass or ileostomy

Advancing age

A family history

Helicobacter pylori bacterial infection

Medications, particularly proton pump inhibitors for indigestion and metformin for diabetes

Pernicious anemia

Pregnancy and breast-feeding

Veganism, vegetarianism and malnutrition

LOW B12 IS A COMMON CAUSE OF FATIGUE

Vitamin B12 is nicknamed the "energy vitamin" for good reason.

B12 turns the foods we eat into usable energy.

We also need Vitamin B12 to make red blood cells.

So, it makes sense that **fatigue is the most common indicator of low levels of Vitamin B12.**

But, Vitamin B12 is needed for hundreds of chemical reactions in your body.

This is why someone with low B12 can get a lot of different types of symptoms...

From head to toe.

Here are a few other symptoms of low vitamin B12:

- Heart palpitations
- Shortness of breath
- Lump in your throat
- FATIGUE
- Depression
- Anxiety
- Feeling faint
- Tinnitus
- Muscle spasms and twitches
- Confusion and Dementia
- Dizziness
- Numbness, tingling, or burning sensations
- Skin, hair, and nail problems.

Read that list again. Every system in your body is at risk if you don't get enough B12.

As you can see...it can be HARD for a doctor who doesn't understand B12 to figure out what's going on with a patient who is tired, dizzy, and complains of numbness and tingling, for example.

This is why I talk so much about Vitamin B12.

OTHER COMMON SYMPTOMS OF LOW VITAMIN B12

BRAIN HEALTH AND BRAIN FOG

1 in 3 seniors dies with Alzheimer's or dementia. They kill more people than breast cancer and prostate cancer combined.

Yet doctors rarely, if ever, worry about low B12 and brain health.

Research shows chronic low levels of vitamin B12 can cause your brain to shrink.

Low B12 literally causes your brain to rot and wither. This puts you at risk for severe brain issues as you age.

NERVE PAIN OR NEUROPATHY

All your nerves are protected by an outer layer called "myelin sheath."

Without protection from the myelin sheath — your nerves can't function.

When you don't get enough B12, your myelin sheaths don't work correctly, causing you nerve problems.

MILD B12 deficiency can lead to neuropathy (pain, numbness, tingling) of your hands and feet.

TINNITUS

Studies show someone with Vitamin B12 deficiency showed significant improvement in tinnitus symptoms.

Just like nerve pain or neuropathy...

When someone is low in vitamin B12, the myelin sheath around the cochlear nerve gets damaged...

This causes hearing loss and tinnitus.

HEART PALPITATIONS AND FEELING FAINT

You can't make enough red blood cells to deliver oxygen without vitamin B12.

Vitamin B12 deficiency is a common cause of anemia.

THREE REASONS WHY YOU'RE LOW IN VITAMIN B12

If B12 is critical to health, why are millions of people suffering from symptoms of low B12?

Even in my clinic...a substantial majority of people were deficient in B12.

Well...there are 3 reasons.

1. Gut
2. Medications
3. Not getting enough in their diet

GUT

The **#1 reason** so many people are low in B12 is their gut.

Vitamin B12 has a unique way it needs to be absorbed into your body...

The acid in your stomach breaks down vitamin B12 in its free form...

And THEN... Vitamin B12 must combine with a protein in your stomach called intrinsic factor.

To recap...

You consume B12; it's broken down into its free form and then combined with intrinsic factors so that it can be absorbed by your body.

If ANY of those steps aren't working correctly — you CAN'T ABSORB B12.

Since millions of people have digestive issues from bloating, indigestion, gas, heartburn, or low stomach acid...

Millions of people can't properly absorb B12.

MEDICATIONS

Many of the most prescribed and over-the-counter drugs directly cause low Vitamin B12.

Antacid medications (indigestion, heartburn, bloating, etc....) are the biggest culprits.

But other common meds like Metformin (Metabolic syndrome, diabetes), H2RA's (Zantac, Pepcid, etc.....), Antibiotics, many NSAIDs (anti-inflammatory)...

All lower your B12.

DIET

Let's face it...

"Experts" and doctors have done a good job scaring people away from red meat.

And sadly...that has led to an epidemic of low B12. Red meat is the best source of vitamin B12.

WHY MOST VITAMIN B12 PILLS ARE USELESS

Many companies use nutrient forms that aren't easily absorbed by the body. It's like the gasoline found in coal.

Sure, every lump of coal technically contains gasoline — but you can't just use coal to fuel your car.

The gas is there but not in a form your vehicle can use.

Many supplements may boast a wide range of nutrients. Still, if those nutrients aren't in a form your body can absorb and use, they're as helpful as coal in a gas tank, and you end up with expensive urine.

The SAME IS TRUE OF B12.

99% of supplement companies use a cheap form of vitamin B12 called cyanocobalamin.

Cyanocobalamin is FAKE. It doesn't exist in nature. It's a lab creation.

And worst of all...cyanocobalamin doesn't work.

Vitamin B12 has to be in the form of **METHYLCOBALAMIN**...otherwise, you can't absorb it.

Most supplement companies don't use Methylcobalamin because they can make better margins selling cyanocobalamin.

Also...**you can't swallow B12.**

What I mean by that is...if your current B12 supplement is in a pill or capsule...then it's useless.

Remember...you need both the stomach acid and intrinsic factor to properly get B12.

When you swallow a pill or capsule with B12, it doesn't stay in the stomach long enough.

So...the best way to get Vitamin B12 is in a SUBLINGUAL tablet that dissolves under your tongue.

Finally...most B12 supplements simply don't have a high enough dosage to do anything.

That's why our Vitamin B12 comes in sublingual tablets of Methylcobalamin at 4000mcg.

If you're low in B12, it's time to boost your levels to feel fantastic again.
