

THE MARTIN CLINIC

THE ROUTE FROM HEALTH TO DISEASE...

THE ROUTE FROM HEALTH TO DISEASE

WHERE ARE THEY NOW, AND WHERE ARE THEY GOING?

We want to thank everybody for joining with us today.

We've got a lot of exciting stuff to go through!

Right off the bat, we want to just share whether or not you're in the place.

Then after, you can decide and say, "Hey, I want to stick this out." Or, "No, this is definitely not for me."

....

YOU ARE IN THE RIGHT PLACE...

First of all, you're in the right place if you aren't feeling well and you're not quite sure what's going on....

Then this is definitely the place you want to be.

...If you've been tested by your doctor and you were told that everything is normal even though you don't feel normal.

This is a very common issue as well, so you're right in the place then.

Also, if your energy isn't as good as it used to be and you're not quite sure why that is, if it's not quite as good as it used to be, then you're definitely in the right place...

YOU ARE IN THE RIGHT PLACE...

If you want to get better, but you're not sure where to start.

It's a question we get a lot of times too.

....There's a lot of information out there.

Hey listen, if you're here and you're healthy and you want to make sure you stay that way, then this is definitely the place for you.

Again, like we do on all of our trainings ... if you stick around to the end, we want to give you a bonus for doing that.

We'll talk about that in the end.

OUR STORY

Most people would assume this is where our story starts...

BUT, it's not

...and we're very proud of this by the way that the Martin Clinic started by my great-grandfather back in 1911.

That's quite a long time ago.

We celebrated our 100th anniversary a few years back!

MARTIN CLINIC

EST. 1911

He was a real pioneer.

Let's be honest though ... People thought he was crazy.

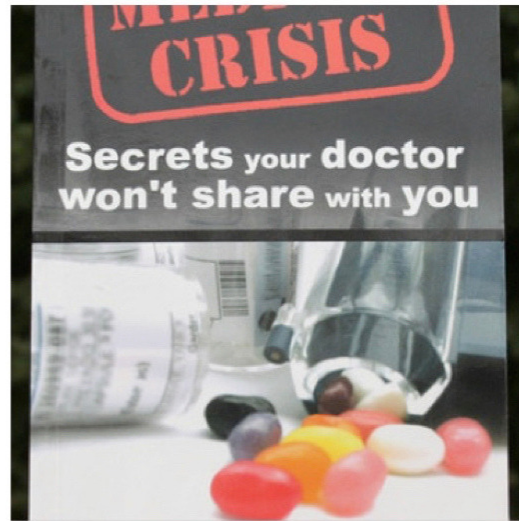

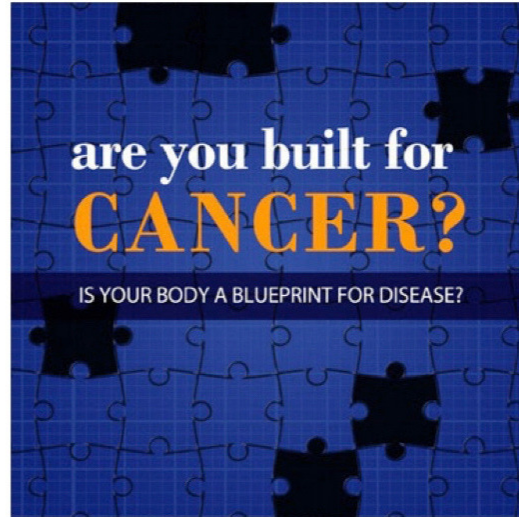

A lot of the mainstream medicine back then would actually think that he was nuts in what he did.

.... He definitely thought outside the box.

Those are in the days that when you went against medical mainstream, they put you in jail. They literally would lock you up overnight if they didn't like what you were doing.

Yeah, my grandfather went to court.

BEFORE THE BOOKS...

That's what I mean. It's just crazy times, right?

Thankfully, we've come a long way since then, but that's not when our story actually starts.

Since that point, we've written a whole whack of books and many of you have read them...

We're very proud of the books, but that's not even where our story starts in terms of that.

Many of you know, but this here is exactly where our story starts.

That's a picture of my mom.

That was taken at one of our book launches on the last book we wrote, which is Eat Fat, Get Lean. That's a picture of her and that's where our story starts.

We like to tell this story because it relates to a lot of people that are listening. This is something that I remember as a teenager that impacted me and I'll let you tell the story. Really, I started to see, by the way, a lot of people in my office in 1980s. They weren't feeling well. It was almost like an epidemic in our hometown. It was almost like a new phenomenon of real fatigue, coming out of nowhere. Literally, exhausted. That's when people from all over started coming to our clinic.

My mom is a registered nurse and worked with me at the office, four kids. She used to go running every morning. My dad, Dr. Martin Sr would run three miles and she'd run five miles.

She was the ever-ready bunny, like never, never stopped.

Then all of a sudden she just started feeling unwell. You talk about somebody that was the most motivated person you've ever met, that was her. She just had trouble much like my other patients that were getting this. (the epidemic of our town)

It was almost like, What? Did she pick up a virus?
.....What was it?

In those days, they were calling it in the Epstein–Barr virus or the Yuppie Flu. They didn't know what to call it, but it was four major symptoms and that was fatigue. I mean real fatigue. Exhaustion would be cognitive issues where their brain wasn't working as well. Trouble focusing. Sort of like having cotton on the brain. Fibromyalgia symptoms. Pain all over. Unexplained pain. Then just the insomnia. Even though you're exhausted, she couldn't sleep well. My mom got us going. I had seen it before but I didn't really know how to treat it and I didn't know what to do. Doctors were stumped....

They tested everything on her.
Really, at the end of the day, all of her blood work was pretty well normal. She had inflammation ...

OUR STORY

Yeah, nothing would standout. Nothing that would cause that type of change in a person's life.

That's the story of the Martin Clinic.

We have developed because of that, what you see now, our real purpose in getting to the bottom of a problem

AND

*We became **obsessed** with functional health.*

From that point forward, one of the things that I know we set out to do and we've been doing it ever since is one of the frustrations that you went through is there was not a lot of information out there and everything was tightly guarded or they just didn't know.

I know one of the things that we try to do is we try to share as much information with people as possible. We try to take complex things, break it down simply. We write a lot of newsletters. Do a lot of videos... We just try to get a lot of information out there to help people. We switched gears after that. I was young, but I still remember that. I still remember the impact that, that had.

OVER THE YEARS...

Basically, over the years, since then, we have essentially analyzed tens of thousands of patient visits and this is what we have learnt about the path from health to disease.

I'll summarize it first and then we're going to go into more detail because this is just a real oversimplification.

(time for the good stuff)

Here's the summary...

The first fact we learned...

This is really the first fact that we learned. We learnt this quite a while ago. What we learnt is that a person doesn't go to bed one night healthy and wake up diseased the next.

This is, by the way, a very good thing because you can imagine if you can go from health to disease literally overnight it would be a disaster, but thankfully, that's not the case at all.

The second thing that we have learnt over the years is that the body will give you very specific clues as you move from health towards disease. The frustrating thing with this can be is that these clues will not necessarily show up in standardized blood testing. That's what we want to talk about today.

*We have analyzed tens of thousands of patient visits and this is what we learnt about the **path** from health to disease...*

What we have found is that there are four specific stages that people go through as they go from health to disease.... that's what we're going to talk about for the rest of this.

What we want you to do throughout this, is that we want you to just think and say.... By the end of it, we want you to be able to say to yourself,

"Okay, I have an idea where I'm at on that path. Where am I on that road from health to disease?"

That's what we want you to think about throughout this guide....

As a person goes from being ... We call it the state of wellbeing.

They move into the second stage, which is kind of subclinical.

Then their wellbeing is overtaken by symptoms and then they are in a state of disease.

In between the third and fourth stages is what we call the "now or never zone"we're going to talk about this in a lot more detail as we move forward.

Let's talk about stage one, which is the idea of the state of wellbeing. This is an interesting question.

WHERE ON THE PATH ARE YOU?

We've asked this question to many different people over the years because we always find it interesting to find the answer to this.

What does it mean to be healthy?

This answer will really depend on who you ask. We've asked this question to a lot of people over the years. For many years, the answer was this. Being healthy means the absent of disease. A person is healthy if they don't have a disease, but that is quite frankly just ... stupid

And the reason why is... does it mean that the day before a person is diagnosed with a disease that they were healthy?

What does it mean to be healthy?

Of course, not.

There are many people who are disease-free but aren't healthy.

If you ask a fitness person, personal trainer or fitness pro or any of them what the definition of health is, well, they could never imagine that a person could be healthy if they have a higher than normal body fat percentage.

That would be taken right off the table at healthy.

Health has to do with body fat percentage.

But that is stupid...

Well, let me ask you a question.

Can health be judged simply by weight and body fat?

They have abs showing, muscles bursting out of their shirts and have absolutely

no energy, no immune system and can't sleep at night and we see them in our clinic every week, we see a fitness person who's in "great shape," but isn't healthy.

This is very common.

STAGE ONE

THE STATE OF WELLBEING...

If you ask a doctor or the healthcare profession, and we've asked many of them, this is what the answers we get. You'll get a bunch of different answers. Some will talk about the lack of disease.

Others will talk about BMI, which is body mass index, which by the way is a joke... Our official diagnosis of BMI is a joke.

Cholesterol levels, which by the way is the largest HOAX ever in the medical system. The concept of cholesterol, well that's another issue for another time. Those are various things.

My doctor says I'm healthy because my cholesterol levels are low....

DOCTORS....

How many people have gone to their doctor and had their physical and all their tests came back normal and within a weeks or so, they have a heart attack or they get the diagnosis of cancer?

Yeah. Basically, that's what happens.

They'll declare you're healthy after a bunch of blood test that come back normal. What is our definition of healthy? We have a slightly different definition of healthy than this. This is something that we think is very practical and what we have defined over the years.

We worked on this definition throughout the years.

What is our definition of healthy?

Here is our definition of what somebody in the state of wellbeing, somebody who is healthy looks like.

First of all, they have vibrant energy.

This is a great indicator.

Energy is a great indicator of how things are going in your body.

If you have great energy and then all the sudden your energy is not quite what it used to be, that's an indicator that something is going on, and we'll talk about that...

- ▶ Vibrant Energy. This is a good indicator.
- ▶ Ages slower than the norm (biological age)
- ▶ Little to no inflammation
- ▶ Absence of symptoms.

State of Wellbeing

The second thing is that this person ages slower than normal. What do we mean by that?

We like to talk about something called a **biological age**, which is the age that's going on, **on the inside of you versus the outside of you**. That's important to understand... Some people could be 65 and have a biological age of somebody who is in their 50s. Somebody in their 50s can have a biological age of somebody in their 80s.

They are just loaded with free radical damage and inflammation and their cells are rotting faster. Their mitochondria is damaged. They got all these things.

- ▶ Vibrant Energy. This is a good indicator.
- ▶ Ages slower than the norm (biological age)
- ▶ Little to no inflammation
- ▶ Absence of symptoms.

State of Wellbeing

Now, what's also interesting is that your skin is your largest organ, which is also a very good indicator as well a lot of times when it comes to biological age.

Skin is your largest organ, so if your skin is giving you a lot of problems by the way, there's something going on, but that's, again, for another time.

Also, little to no inflammation.

We understand that the body is constantly fighting inflammation off all the time, but a person that's healthy is able to fight that inflammation off, so they have very little to no inflammation. We're going to talk more about that as well.

What is our definition of healthy?

Then, of course, we also have the absence of symptoms, which we're going to talk about as we move on.

That's how we would define the **concept of a state of wellbeing**.

A person is healthy if they fit these descriptions, right?

The problem is, is that there are what we call **state of wellbeing robbers**. There are things out there that are trying to steal that from you.

....They are trying to move you away from being healthy.

STATE OF WELLBEING ROBBERS...

The first thing that we like to talk about is something we call eating outside of your carb tolerance. **Each and every person has a different sensitivity to carbs.** Some people can eat a lot more carbs than others. Some can't handle carbs at all.

The bottom line is, is when the person starts to eat outside of their own carb tolerance, bad things start to happen inside the body. We're going to go through the stages, but it's not a good thing that happens. We'll get into more detail.

...It doesn't happen after a day, but if you read our newsletters, we wrote about how after one week of bad eating can actually add a little bit of fat to your liver.... (fatty liver)

- ▶ Eating outside of Carb Tolerance.
- ▶ Sedentary
- ▶ Lack of Sleep
- ▶ Environmental Factors
- ▶ Antibiotics
- ▶ NSAIDS
- ▶ Dehydration
- ▶ Lack of Vitamin D and Omega-3's

State of Wellbeing

... There was a study saying that sitting is the new smoking.

How active. We're doing a series coming up in our newsletters talking about activity, about fitness. We're going to go through that, but the idea is that if a person is not moving around much, it's going to rob them from that.

Then we're going to get into a few other things as well. Lack of sleep. We're big on sleep. We're big on the importance of sleep. **You are as healthy as your circadian rhythm.** A lot of issues happen to you when unable to sleep properly. What we mean by a lack of sleep really falls into three things. One, having a hard time falling asleep. Two, wake up frequently. Three, a combination of both...

- ▶ Eating outside of Carb Tolerance.
- ▶ Sedentary
- ▶ Lack of Sleep
- ▶ Environmental Factors
- ▶ Antibiotics
- ▶ NSAIDS
- ▶ Dehydration
- ▶ Lack of Vitamin D and Omega-3's

State of Wellbeing

Really, we can add a fourth one and they don't wake up rested anymore.

60% to 70% of the population do not get a proper sleep. It's incredible. It's something that I never heard of before

Another thing, again, that wants to rob you of your health are what we call environmental factors.

There's a lot of things that are involved in that.

I was reading a study recently that they looked at the 4000 or so, even additives to food that has been there and the effect that they have on things like insulin and that is just incredible.

- ▶ Eating outside of Carb Tolerance.
- ▶ Sedentary
- ▶ Lack of Sleep
- ▶ Environmental Factors
- ▶ Antibiotics
- ▶ NSAIDS
- ▶ Dehydration
- ▶ Lack of Vitamin D and Omega-3's

State of Wellbeing

Environmental factors absolutely will impact. In that includes chemicals and that includes the estrogen in the drinking water and the ...Xenoestrogens.

The chemical is everywhere. Antibiotics is a big one as well.

Antibiotics, which you like to say as the best invention, but also can be ...

A curse, right?

Look, we're not anti-medicine. Antibiotics, by the way, are the greatest discovery of the 20th century. They really were

- ▶ Eating outside of Carb Tolerance.
- ▶ Sedentary
- ▶ Lack of Sleep
- ▶ Environmental Factors
- ▶ Antibiotics
- ▶ NSAIDS
- ▶ Dehydration
- ▶ Lack of Vitamin D and Omega-3's

State of Wellbeing

Antibiotics, the problem with antibiotics is that they kill the bad guys, but they also kill the good guys.

What we've been seeing at the Martin Clinic for a lot of years, what my dad used to say and my grandfather used to say...

"Your gut is the root of all disease."

Antibiotics, destroys the flora of your gut.

Now, we know that leaky gut, leaky brain, things like that. Look, it's not railing against antibiotics, ... it's just a major concern because of what they do to friendly bacteria in our systems. **We need healthy bacteria**

WHERE ON THE PATH ARE YOU?

Along that line again is we talk a lot about this as well what we call NSAIDs, which are just basically anti-inflammatory drugs. Many of these are actually bought over-the-counter. Ibuprofen...Naproxen and all those things.

They kill good bacteria in your stomach. They cause inflammation. A different kind of inflammation, which is interesting...

Then dehydration. Water is a thing as well. Especially men. Women have no problem carrying a water bottle around with them. Men just typically don't drink as much water as women, but it doesn't matter. A big percentage of the people coming to our clinic are dehydrated.

WHERE ON THE PATH ARE YOU?

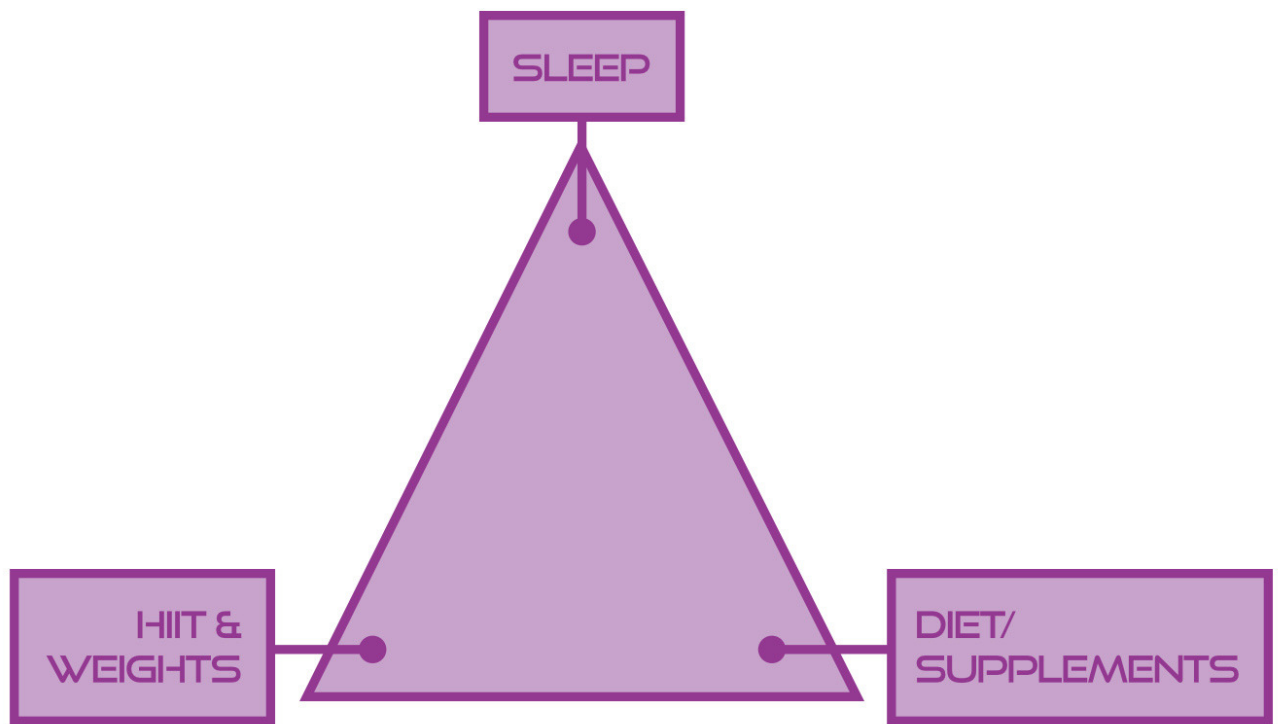

Then another two big nutrients that 90% of the population is deficient in, which is **vitamin D** and **omega-3 fatty acids**.

Omega-3's are just not in our food anymore...

We tend to eat way more omega-6's, but anyways, those are the things.

We don't want to spend too much time talking through them, but those are just some of the things that you could do on a day by day situation that can start to rob you and start to move you along that path from health to disease.

Let's go on...

STATE OF WELLBEING TRIANGLE.

The question is this : **How do you stay healthy?**

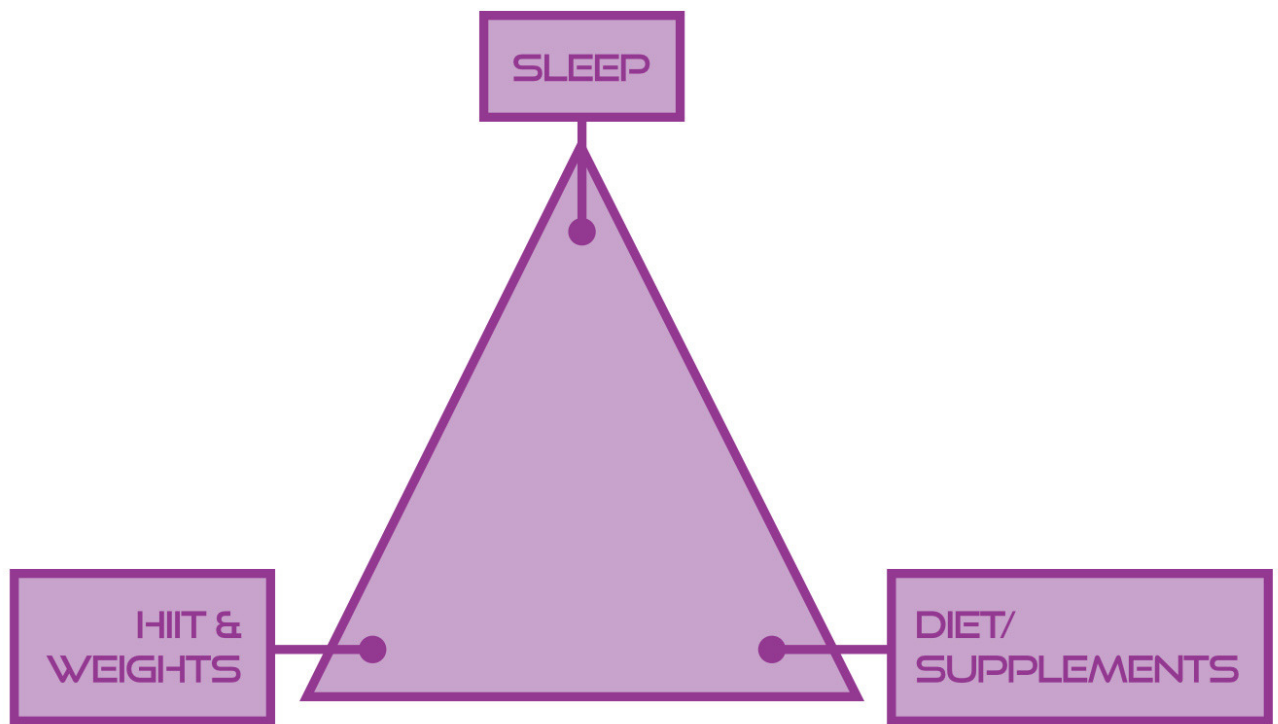

With all these things that are out there, how do you stay healthy?

...This is something that we have shared before in past newsletters, but we want to just share it again.

this is really a triangle that we like to talk about.

It's what we call the state of wellbeing triangle.

These are kind of things that are all necessary for somebody to stay and keep healthy...

STATE OF WELLBEING TRIANGLE.

We have sleep in there because that's huge.

One of the first things that happens is people, when they're not well anymore is their sleep is affected one way or the other, so sleep is a big one.

We just don't get as much sleep.

Then before bed, we all are looking at blue light on our iPads or our iPhones and all the phones.

It's affecting the amount of melatonin we secrete when we sleep. It's having a real effect on us.

*How do you **stay** healthy?*

Then on the left side of that triangle is what we would call HIIT which is high intensity interval training.

We like resistant exercises because one of the things that happens as we age, we lose muscle mass. **We lose mobility and our bone quality starts to decrease.**

Resistant training is the best medicine for that.

We're working on a program, we're calling it the fitness gap and just the effect that as we age, the difference, things that happen with the age and how weight lifting or resistant training plays a big role in that.

State of
Wellbeing

- ▶ Foundational Nutrients. Probiotics, Vitamin D, Omega-3, Pine Bark Extract.
- ▶ Sleep.
- ▶ Carb Tolerance
- ▶ Weights and HIIT

State of Wellbeing

The point is, the proper diet and supplements.... By that, we mean ... We'll talk about this now.

When it comes to supplements, there are a few foundational nutrients that we have found over the years that most people are deficient

Probiotics is being one. People are chronically deficient of vitamin D. Omega-3 specifically. We like DHA because of the effect it has on inflammation of the brain.

Our story really revolves around pine bark extract, which is within our Navitol. That's just a very powerful antioxidant.

State of Wellbeing

- ▶ Foundational Nutrients. Probiotics, Vitamin D, Omega-3, Pine Bark Extract.
- ▶ Sleep.
- ▶ Carb Tolerance
- ▶ Weights and HIIT

State of Wellbeing

My dad says a lot funny thing at the office because he talks about the blood B12 is very, very inaccurate.

The blood testing, the serum testing to B12 is 100 years old. It had its birthday and it should be put to bed.

We do a saliva test for it. It's much more accurate. Most people today have very little or very low levels of B12 and your body is not going to work well. There's a lot of reasons for that. A combination of digestive stuff and just not getting enough on our diets. Then we mentioned sleep.

Again, diet. People always say, "You guys are low carb." We are, but we're not ... Low carb is a spectrum.

STAGE TWO

WELLBEING THREATENED

Some people can consume more carbs.

I think the reality sets in for people when more than 40% of their diets come from carbohydrates. I think that's when people start to develop a lot of their issues.

There are studies showing that when people lower to 30%, 20% and then depending. We have people sometimes go lower depending on what's going on in their life and what kind of things they're working through, but finding all, which are carb tolerances and eating within that carb tolerance is a big thing.

THE CLUES START...

This is where we tell people. This is when the clues start to kick in. Remember, we mentioned, you don't go to bed healthy. You wake up diseased. It's a process.

This is where your body starts to give you clues if you're listening.

As we mentioned, the energy gets lower.

Again, energy is a spectrum.

Some people are always higher energy, but for them, they say, "Well, my energy is not quite what it used to be." It's different for everybody.

- ▶ Lower energy
- ▶ Weight Gain
- ▶ Cognitive decline
- ▶ Digestive Issues
- ▶ Allergies. Environmental and/or food
- ▶ Skin/Hair symptoms
- ▶ Hormone symptoms
- ▶ Sleep problems

Wellbeing threatened

Weight gain is another clue.

Your body is, for some reason, if starting to gain weight... indicates a hormonal problem that's going on underneath when people start to gain weight.

Their brain might not be as sharp anymore either!

They're starting to get some digestive issues. They're starting to get some allergies or environmental or food stuff.

Intolerance is going on. They're starting to notice maybe their skin in their hair is not as healthy as it used to be....

- ▶ Lower energy
- ▶ Weight Gain
- ▶ Cognitive decline
- ▶ Digestive Issues
- ▶ Allergies. Environmental and/or food
- ▶ Skin/Hair symptoms
- ▶ Hormone symptoms
- ▶ Sleep problems

Wellbeing threatened

...Getting hormonal symptoms for the first time or noticing some changes (nails)

Again, a person that's starting to move from health to disease may not get all these. May get one or two, but we found generally speaking that somewhere along the line, when people look back, they're like,

"Yeah, I notice my energy wasn't quite what it used to be. All the sudden, I just started gaining a little bit of weight." Or my skin or whatever. These are the first clues that the body will give you that you're no longer in that state of wellbeing. Your wellbeing is being threatened. It's not exactly the way it should be.

Now, listen...

- ▶ Higher than normal insulin
- ▶ High Cortisol
- ▶ High Estrogen
- ▶ Dysbiosis
- ▶ Free Radical Damage

Wellbeing threatened

Candida...

Leaky gut syndrome is a controversial thing for people, but I don't know why it is.

There is what they call joint-gut axis.

There is a brain-gut axis. There is a skin-gut axis. There is a heart-gut axis. That just basically means that there's a connection between all those things in your gut.

How does that happen? That's leaky gut syndrome.

My dad used to say that if **your plumbing ain't right, nothing is right.**

- ▶ Higher than normal insulin
- ▶ High Cortisol
- ▶ High Estrogen
- ▶ Dysbiosis
- ▶ Free Radical Damage

Wellbeing threatened

Well, 80% of your immune system is found on your digestive system.

Your feel good hormones are found in your gut more than your brain.

Which is why depression and anxiety and all that a lot of times for people also have a lot of digestive component. These are the things we see and then we start to see a little bit of free radical damage.

Free radical damage, in case you don't know what that is, it's a fancy way of saying rusting. The body is rusting out faster than it should. That has a pretty big impact on the body.

INFLAMMATION

Again, those are these things that are starting to happen...

If you're noticing those things, you're in that stage where **you're just starting to move away from being healthy** and is being threatened.

Now, really ultimately, this is the stage where inflammation starts to take over...

You start to make inflammation.

All of these things here in the symptoms. Low energy, weight gain, brain, digestion, allergy, skin. **They are ALL underlying inflammatory issues.**

STAGE THREE

WELLBEING OVERTAKEN

Now, that's stage two.

Stage three is what we call when **your wellbeing is literally being overtaken now**. Now, it wasn't just threatened, it's been overtaken.

Now, you're starting to see you're moving on that right end of the stages from health to disease...

... We call these diagnosable symptoms. Don't worry about that for a second. We're going to come back. Basically, a person in this stage here, they continue with the same symptoms as before, but here they are. They're getting worse. Their energy may be getting worse than it was before. They're gaining more weight than before...

You get the idea.

Their digestive symptoms are getting worse. Their allergies are getting worse. It is incredible. They have allergies to food. They have intolerances to food...

Do you know how many people clear their throat in the morning after drinking coffee with milk in it or cream in it because they have an allergy and **their body's way of protecting itself** is increasing mucus production so they're clearing their throat all morning?

...Kids with wheezing and asthma from dairy, it's just incredible.... All these other things.

A close-up photograph of a doctor's hands holding a white clipboard. The word "SYMPTOMS" is printed in large, bold, teal capital letters on the clipboard. The doctor is wearing a white lab coat and a stethoscope is visible around their neck. The background is slightly blurred, showing more of the doctor's coat and the stethoscope.

SYMPTOMS

DIAGNOSABLE SYMPTOMS...

Basically, what happens in that third stage is that these things have gotten worse, but this is what we call now diagnosable symptoms. **These are things now that may start to show up in people's actual blood work or actual testing** that they go even in mainstream medicine.

These are the things they might find. Hyperinsulinemia is just basically too much insulin, it's high.

This is the stage where people start to have high blood pressure because you don't just go from healthy to high blood pressure overnight.... You go through that second stage first where those things are behind the scenes are starting to happen. Inflammation is creeping up.

- ▶ Hyperinsulinemia
- ▶ High Blood pressure
- ▶ Uric Acid
- ▶ High Triglycerides
- ▶ Obesity
- ▶ Thyroid or other hormone producing organ.
- ▶ Fatty liver and/or metabolic syndrome

Wellness overtaken

High blood pressure is a symptom of too much insulin, but that's again for another time.

They may start to develop some higher uric acid levels. Their triglycerides may be getting high. This is when they start to really fight weight even a little bit more. Look at the bottom where it says fatty liver and or metabolic syndrome. They might have a lot more belly fat than they used to have as well. They get a lot of metabolic issues that are going on. Polycystic ovary syndrome or they have all these different metabolic things...

This is where we start to see the effect or the actual hormone producing organs like the thyroid, the adrenals, the ovaries. They start to give real problems in this stage.

*This is the stage where people tend to start taking **medications**....*

...They're not diseased yet.

They'll label high blood pressure as a disease in a sense and they'll give you ... Which brings me to the next thing. This is the stage where people tend to start taking medications because the symptoms have gone to the point where they need medications.

Their doctor is like, "Your blood pressure is high, so we got to lower your blood pressure."

.... Because, by somehow just keeping your blood pressure magically lowered with a pill, it's going to get rid of the underlying issue???? **(remember: High blood pressure is a symptom of too much insulin)**

NOW OR NEVER ZONE

You're also going to notice now...

As we move on, this is what we call the now or never zone.

That zone is between stage three and stage four.

This is your last chance before disease kicks in. This is the time where if changes aren't made, the next step is literally disease.

That process can take a while still.

A person can have these metabolic syndromes for a long time or high blood pressure for a long time and then not be diseased yet.

Now or Never Zone

Wellbeing
Overtaken
by Symptoms

State of
Disease

The thing is you have to understand is that when it comes to functional healthcare, when it comes to treatment, you are moving from prevention to actual treatment, which again changes things.

It's always better to prevent and easier to prevent than it is to treat, which is why we have a big frustration with the whole idea of ...

I mean the slogan was never official, but it was out there, which was **early detection is the best form of prevention**. Let's catch it early.

It's so much easier to prevent it in the first place than actually treating it after. Prevention is always easier.

STATE OF DISEASE

I just remember writing this in our book, "Are you built for cancer?"

I was talking about the CDC, the Center for Disease Control said that by the year 2030, the amount of money that we will spend trying to treat just diabetes, just the amount of diabetes there will be. Nevermind cancer. Nevermind cardiovascular, although they're very much linked will bankrupt the governments in North America all alone.

Forget, folks, carbon and all this. The biggest threat to our society in terms of its finances is the way we treat disease today, because we wait and then we spend a fortune trying to fix it when people are sick.

WHAT STAGE ARE YOU IN?

Now, we've moved through that third stage. We've passed the now or never zone and this is the easiest one to talk about because **now a person is literally in the state of disease.** The person now has heart disease. They have cancer or they have an autoimmune disorder. They got type 2 diabetes. On and on and on.

The point is that at this point, they're loaded with inflammation and they just didn't wake up with heart disease. **That's not how it works.** Their body went through a stage.

The interesting thing is some people will go through these stages much faster than somebody else for various reasons.

WHERE ON THE PATH ARE YOU?

Other times, there are other factors that go into there, right? **The reality is, is that people don't go to bed healthy one night and wake up diseased the next.** There are stages to this, so they go through the four stages. The question we want to ask you again, at this point now is that what stage are you in. **Do you have an idea of where you're at on that scale?**

If you're in the state of wellbeing that's awesome and you want to make sure you do everything you can to stay on the left side of the scale.

Now, if you feel that you're just starting to get some symptoms and you're starting to move down that path, then you're obviously in that stage two, stage three and then stage four.

BASED OFF THE FACT THAT THE BODY GIVES CLUES...

Again, it's a little bit of a fluid scale. You could be moving along in that path.

We just want you to get a better understanding of this here.

Each stage will also require a little bit different of a treatment approach.

It is vital to find out where you are at on the road from health disease.

This is our passion.

We get excited about these things here.

IF YOU AREN'T WELL AND NOT SURE WHERE TO START

It really is our passion. Somebody asked my dad the other day, "Doc, are you going to retire?" I said, "You would hurt me if you made me retire." Retire? This is too much fun...

You never stop learning and you never stop ... It's really exciting. It's amazing how many people, when they take control. It's amazing. **The word doctor by the way means teacher.**

I always try and I know Tony, you are big on this. We try and get people to understand. **The word medicine is gone wrong in a certain way. The doctors don't talk to you anymore.** You're going to your doctor and the very few of them, "You want to ask a question? Well, come back the next time." Good luck if you get to ask questions.

WHERE DO YOU START IF YOU ARE FRUSTRATED?

The thing is, **information is power**. It really is because people said, "Well, if I just knew what to do."

Anyways, look, we're very passionate about this.

Another question we get asked all the time if people say, "Well, how do I find the where I'm at? How do I find what stage I'm in? How do I find the where I'm at?"

Another question we get asked is, **"If I'm not well. I'm not sure where do I start. Then where do you start if you are frustrated?"** We get a lot of people that email us and call us and they come in and they're frustrated. They don't feel well. They know something is wrong and yet they can't seem to get any answers....

CHRONIC DISEASES

WHAT SHOULD YOU DO IF YOU ARE DISEASED?

Then also, what should you do if you're diseased? What happens if you have heart disease? What happens if you have type 2 diabetes?

What do you do at this point?

These are all things. Maybe you're healthy and you want to stay that way, so what do you do? This is why, again, we developed a testing system. We talk with this all the time. Sometimes we bore people with this, but we do talk about this a lot.

We developed testing and we call that our biomarker testing system.

BIOMARKER TESTING SYSTEM

Really, it's based off the fact that **the body gives clues and we base our testing off the fact that the body gives clues all the way throughout the stages from health to disease.**

We talk about some of them. Too much insulin.

Yeah, insulin resistance. It's a big one.

We've perfected this process over the years. We've gone through. We've looked at all these things over the years.

Basically, we always tell people and say,

"Well, listen, there are two ways that you can get your biomarkers tested."

BIO-MARKER TEST AT HOME TEST KIT

bringing the Martin Clinic to your front door

- ▶ There are two ways to get your biomarkers tested...
- ▶ In our clinic or using our At-home kit.
- ▶ We developed the home kit because we were getting a lot of calls from people all over North America asking us for help.

The Route from Health To Disease

For the longest time, it used to be, they had to come to our clinic and we're way up in Sudbury. We got people from all over the place. We got people from the States. We have people from overseas and that's a long way to come.... Sudbury is not the easiest place to get to especially in the winter times.

... That's what we came up with the **at-home test kit**. We developed a kit for that purpose. The at-home kit process is very simple. **What we like about it is the person also gets a consult after they get the results with our health coach who's fantastic.** They've been very well trained in all this stuff.

It's a very exciting thing.

A hand in a suit pointing forward, set against a background of blurred city lights at night.

BONUS

THANKS FOR WATCHING.

We want to thank you for listening

Here's a discount code to use on your next order

DISCOUNT CODE: WEBINAR10

... it's only good for a few days before it expires!

A photograph of ten light-colored wooden blocks arranged in a single row on a dark, textured wooden surface. Each block has a single black letter on it, spelling out 'THANK YOU' in all caps. The blocks are slightly irregular in shape and the letters are hand-painted or stenciled.

THANKS FOR WATCHING.

If you have any feedback at all, just send it to info@martinclinic.com.

Again, we want to thank you for just joining us for this long on this online workshop.

We hope you enjoyed it as much as we enjoyed teaching the information.
